

Supplementary material

Table S1. Socioeconomic and built environment variables used in this study.

Domain	Variable Name	Variable Description
Age structure	0–24	% of persons aged 0–24
	25–44	% of persons aged 25–44
	45–64	% of persons aged 45–64
	65+	% of persons aged 65+
Marital status	Unmarried	% of unmarried persons
	Divorced	% of divorced persons
Education	Illiteracy	% of illiterate persons
	Low	% of persons with lower education (high school or less)
	Tech	% of persons who finished technical secondary school
	Univ	% of persons with a bachelor's degree
	Master	% of persons with a master's or PhD
Income source	Labor	% of persons whose main source of income is labor
	Pension	% of persons whose main source of income is a pension
	Supported	% of persons who are supported by other family members
	Other	% of persons whose main income source is insurance, allowances, or properties
Occupation	Managers	% of persons who are heads of government agencies, political parties, or enterprises or are business executives
	Professionals	% of persons working as professionals
	Clerical	% of persons working as office administrative clerks
	Other(skilled)	% of persons working in commerce and service sectors, skilled technicians, farming, forestry, animal husbandry, fishery and water production sectors, and sectors related to manufacturing and transportation.
Housing	<29	% of houses 29 square meters and less
	30–59	% of houses between 39 and 50 square meters
	60–119	% of houses between 60 and 119 square meters
	120+	% of houses 120 square meters or more
Built-environment	Density	Population density (persons per square km)
	NDVI	Neighborhood greenness (NDVI)
	REI	Revised Entropy Index (Land Use mix among Residential Land, Green Land (excluding forests), Public Building Land)
	BAL	Balance Index (Land Use mix between desired and undesired land-use types)

Table S2. NDVI summary statistics (75th percentile, median, mean, 25th percentile, standard deviation) per variable and group.

		Group	75 th	Median	Mean	25 th	StD
Age	0–24	ALL	0.2265	0.2017	0.2118	0.1821	0.0527

Table S7. Percentage of common neighborhoods in groups.

	High density	Low density	High NDVI	Low NDVI
High density	/	/	1.48%	25.18%
Low density	/	/	31.48%	7.77%
High NDVI	1.11%	31.48%	/	/
Low NDVI	25.92%	8.51%	/	/

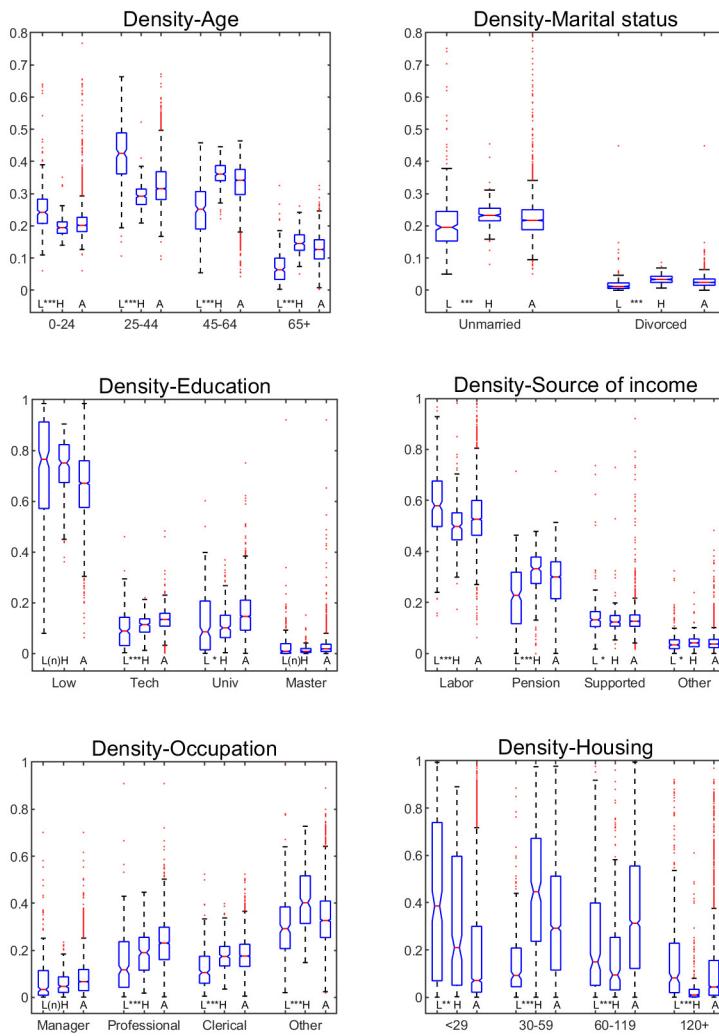

Figure S1. Distributions of Low (L) and High (H) density groups as well as the complete set (A) across age, marital status, education, source of income, occupation, and housing. The Mann–Whitney U-test is used to compare L-H, L-A, and H-A distributions. Horizontal red lines express median values. This graph depicts the results of the Mann–Whitney U-test for the L-H comparison only. P-values across all comparisons are presented in **Table S3**. P-value: $p < 0.001$ *** | $0.001 < p < 0.01$ ** | $0.01 < p < 0.05$ * | $p > 0.05$ (n). Results show statistically significant differences between L-H groups for most socio-economic characteristics.

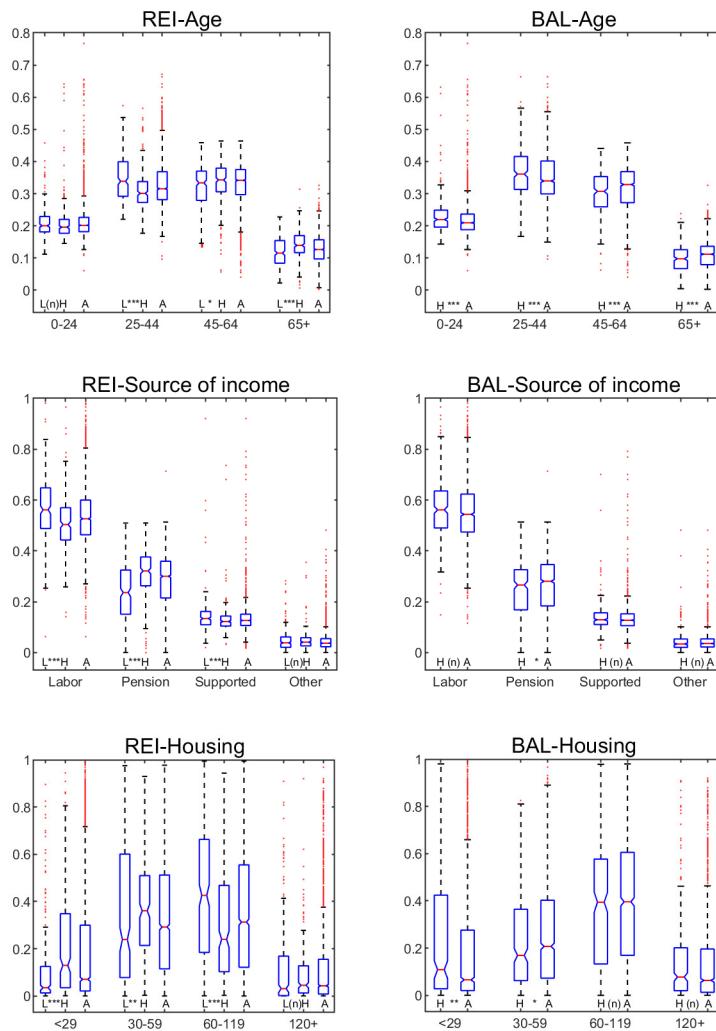

Figure S2. Distributions of Low (L) and High (H) REI and BAL groups as well as the complete set (A) across age, source of income, and housing. The Mann–Whitney U-test is used to compare L-H, L-A, and H-A distributions. Horizontal red lines express median values. This graph depicts the results of the Mann–Whitney U-test for the L-H comparison only. P-values across all comparisons are presented in **Table S3**. P-value: $p < 0.001$ *** | $0.001 < p < 0.01$ ** | $0.01 < p < 0.05$ * | $p > 0.05$ (n). Results show statistically significant differences between L-H groups for most socioeconomic characteristics.
