Values represent odds ratios and 95% confidence intervals in the adults aged ≥ 40 . F: female; M: male; TG: triglyceride; LDL: low-density lipoprotein; CRP: C-reactive protein; HDL: high-density lipoprotein; The polygenic risk scores (PRS) of the 8 SNP model generated from GMDR was divided into three categories (1-6, 7-8, and ≥ 9) by tertiles as the low PRS, medium PRS, and high PRS, respectively. The low PRS was the reference for both Covariate set 1 and Covariate set 2. Covariate set 1: adjusted for age, gender, body mass index (BMI), and residence area. Covariate set 2: adjusted for age, gender, BMI, residence area, physical activity, education, smoking, years with gastric cancer, and intake of alcohol and energy. Significantly different from the major allele in logistic regression analysis after adjusting for covariates at * $P < 0.05$, ** $P < 0.01$, *** $P < 0.001$.
