

Figure S1. Examples of quantified counts per minute (cpm) values for different dilutions of the fish extracts (small black circles), with a distinction between values below (RBA^+) and above (RBA^-) the EC_{80} marked by horizontal red lines for six separate RBA experiments. The EC_{20} for each individual experiment is indicated by black solid triangles and the maximum binding values are reported (bigger black circles) with their corresponding standard deviations.
