

Figure S1. rs6942067 genotype status in the TCGA HNSCC cohort for HPV positive and/or drinking patients (n = 47) and HPV negative non-drinker patients (n = 20). Patients with an average of ≥ 1 drink per day were considered drinkers while patients with an average of < 1 drink per day were considered non-drinkers. Only 67 patients had whole genome sequencing data for the TCGA HNSCC cohort. HR and p values are for a Pearson's chi-square test and a recessive model of penetrance.
