

Figure S1. Let-7i transfection Lipofectamine transfection of let-7i mimic resulted in up-regulation of mature let-7i relative to scramble control. Let-7i levels in parental cells relative to each other have been previously described 1. Error bars: SEM. ** $p \leq 0.01$, **** $p \leq 0.0001$. p Value ≤ 0.05 was considered significant.

Figure S2. Full images of Western Blots staining for Tubulin, LIN28A, and HMGA2.

Figure S3. Images from wound healing assays. Representative images from control (Scramble) and *let-7i* overexpression for four cell types is shown.

Figure S4. *Let-7* reduces invasion. Invasion assay performed 48 hours post *let-7i* over-expression. Error bars: SE. * $p \leq 0.05$. p Value ≤ 0.05 was considered significant.

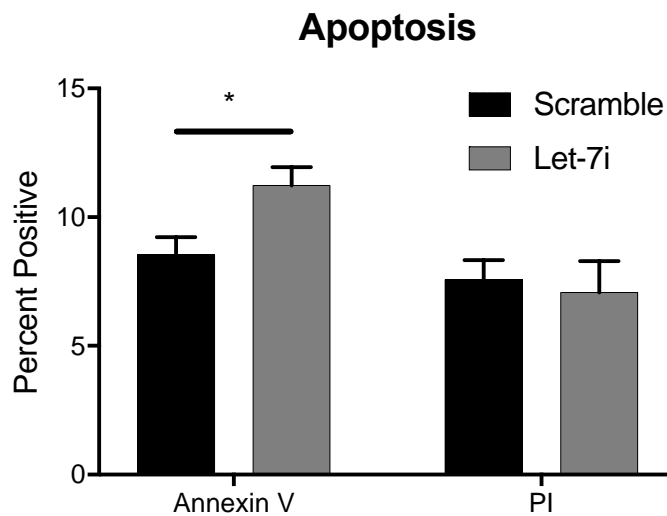

Figure S5. *Let-7i* increases apoptosis. Flow cytometry analysis was performed 48 hours post *let-7i* over-expression in OVCAR8 cells and stained for Annexin V and PI to assess apoptosis. Error bars: SE. * $p \leq 0.05$. p Value ≤ 0.05 was considered significant.

A**B****cMYC Protein Level**

Figure S6. Let-7 effect on cMYC protein level. Let-7 OE resulted in cMYC repression in PDX8 and OV8 while having no effect on PDX4 and PDX6. * $p \leq 0.05$, *** $p \leq 0.001$. ns, not significant. p value ≤ 0.05 was considered significant.
