The original scans of the blots are shown on the left and the red squares depict the images used for the final figure shown on the right. The red numbers below each blot panel on the final figure indicate the quantifications of the blot band intensity relative to GAPDH expression in each condition.

Relative to figure 4D

The original scans of the blots are shown on the left and the red squares depict the images used for the final figure shown on the right. The red numbers below each blot panel on the final figure indicate the quantifications of the blot band intensity relative to GAPDH expression in each condition.

GAPDH

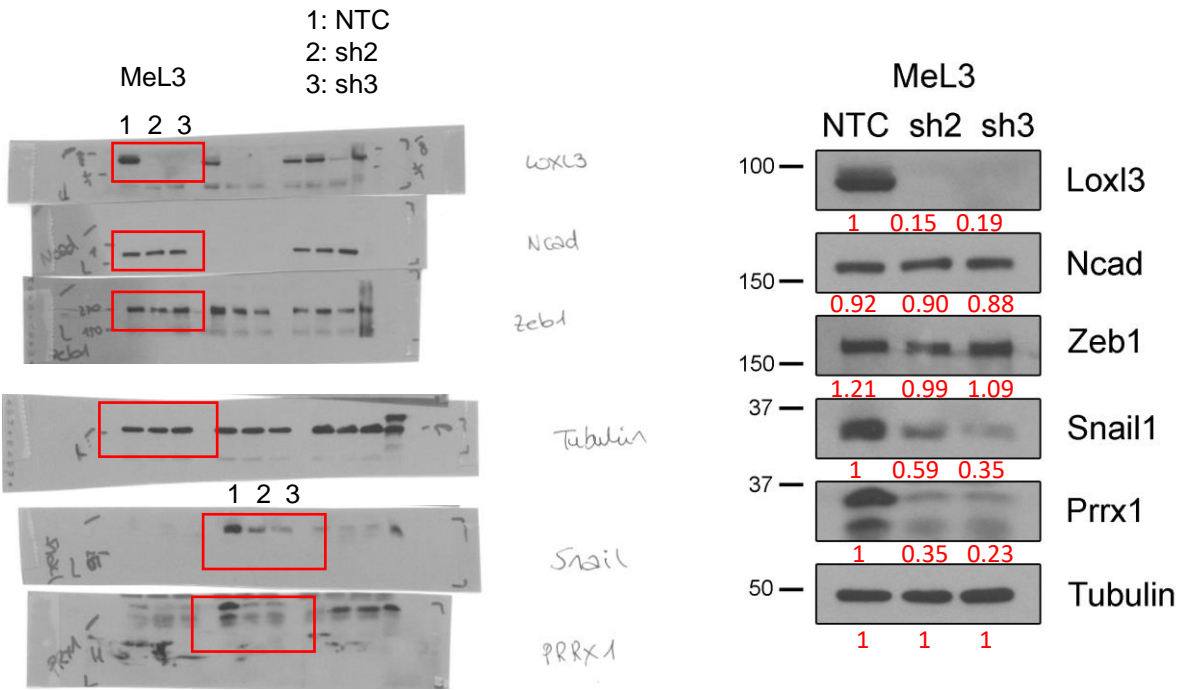

The original scans of the blots are shown on the left and the red squares depict the images used for the final figure shown on the right. The red numbers below each blot panel on the final figure indicate the quantifications of the blot band intensity relative to GAPDH expression in each condition.

Relative to figure 6A

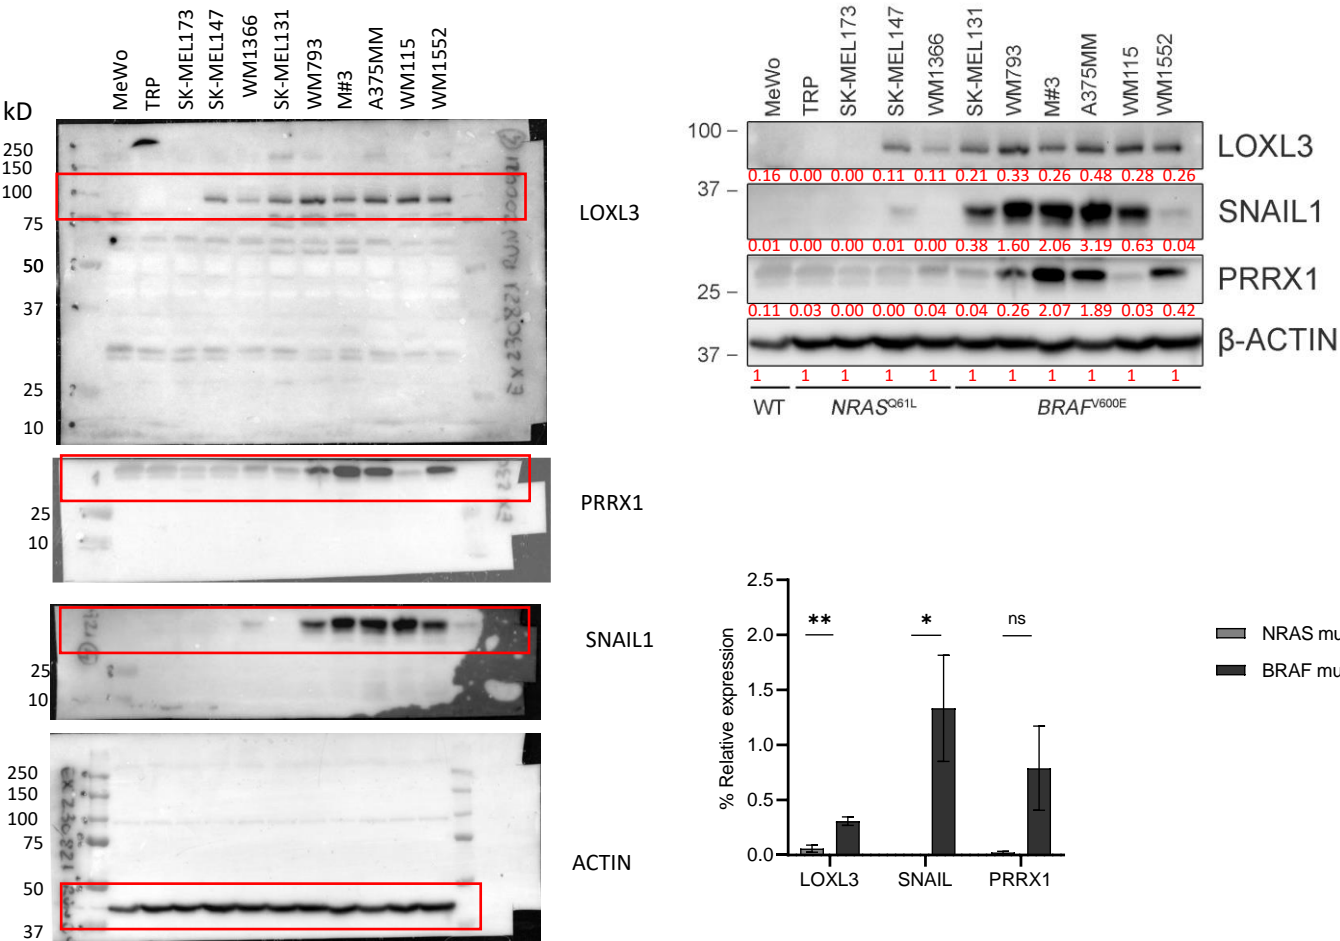

The original scans of the blots are shown on the left and the red squares depict the images used for the final figure shown on the right. The red numbers below each blot panel on the final figure indicate the quantifications of the blot band intensity relative to Gapdh expression in each condition.

Relative to figure 7B

The original scans of the blots are shown on the left and the red squares depict the images used for the final figure shown on the right. The red numbers below each blot panel on the final figure indicate the quantifications of the blot band intensity relative to Tubulin expression in each condition.

Relative to figure 7E

The original scans of the blots are shown on the left and the red squares depict the images used for the final figure shown on the right. The red numbers below each blot panel on the final figure indicate the quantifications of the blot band intensity relative to B-ACTIN expression in each condition.
