

Figure S1

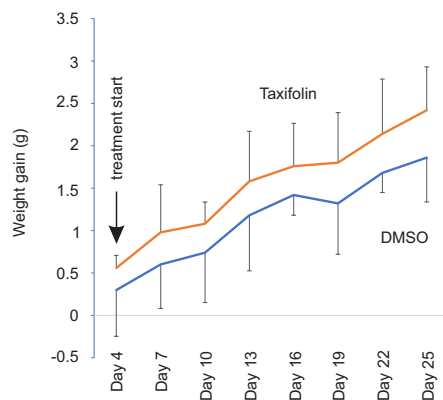

Figure S1. Taxifolin treatment did not result in weight loss. Tumor-free mice of 8-weeks old were administrated with DMSO (n = 5) or taxifolin (50 mg/kg, n = 5) via ip at the indicated time points. Animal weights were recorded. The mean animal weights at day 0 were 20.6 ± 2.5 (means \pm SD) for the DMSO group and 20.9 ± 1.1 for the taxifolin group ($p = 0.84$). As the treatment started at day 4, the weight gains from day 0 to day 4 for both groups ($p = 0.39$) occurred naturally or without treatment; all weight gains were in refence to the base-line weights at day 0. The differences for weight gains between the 2 groups at individual time points were at $p > 0.16$ with the smallest p value being $p = 0.165$ for both groups at day 25.
