

## Supporting Information

The potential towards reversible hydrogen electrode (RHE) has been determined using the Nernst equation,

$$E_{RHE} = E_{Ag/AgCl} + 0.059 \times pH + E^0_{Ag/AgCl} \quad (1)$$

Where,  $E_{RHE}$  is the converted potential versus an RHE,  $E^0_{Ag/AgCl} = 0.197$  V at room temperature (27 °C) and  $E_{Ag/AgCl}$  is the experimental measured potential versus Ag/AgCl reference electrode. The over potential ( $\eta$ ) has been calculated using the following equation:

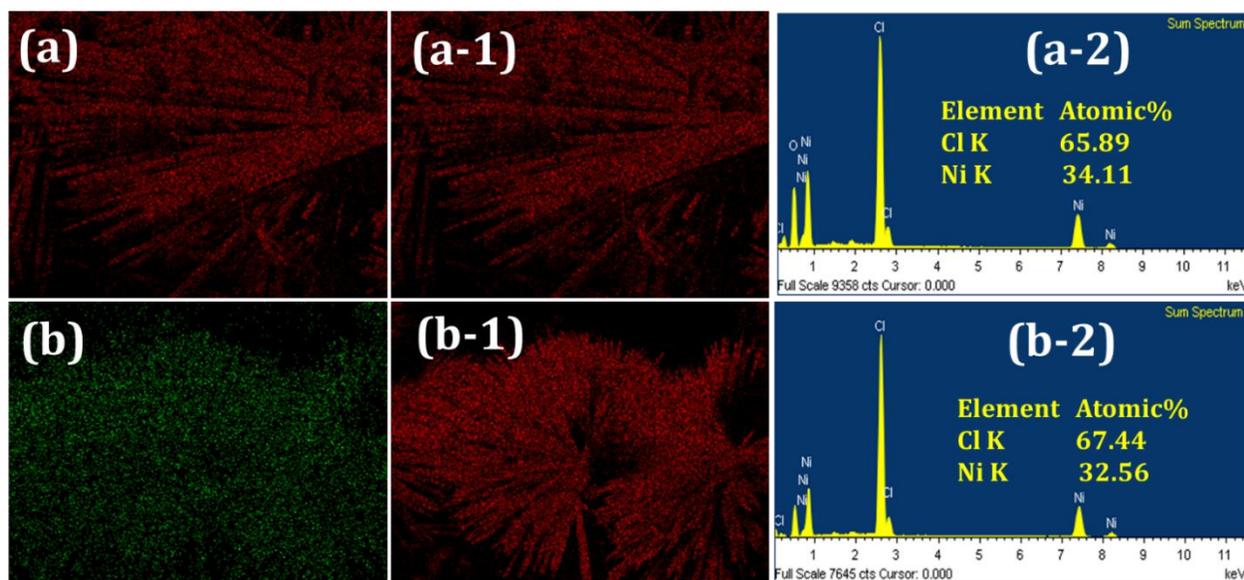

$$\eta = E_{RHE} - 1.23 \quad (2)$$

where,  $\eta$  and  $E_{RHE}$  are the over and converted potentials, respectively.

The Tafel slope has been determined using the equation,

$$\eta = b \log j + a \quad (3)$$

where,  $b$  is the Tafel slope and  $a$  is the fitting parameter.
