1. MW flow device (EYELA), catalyst cartridge, and peripheral devices

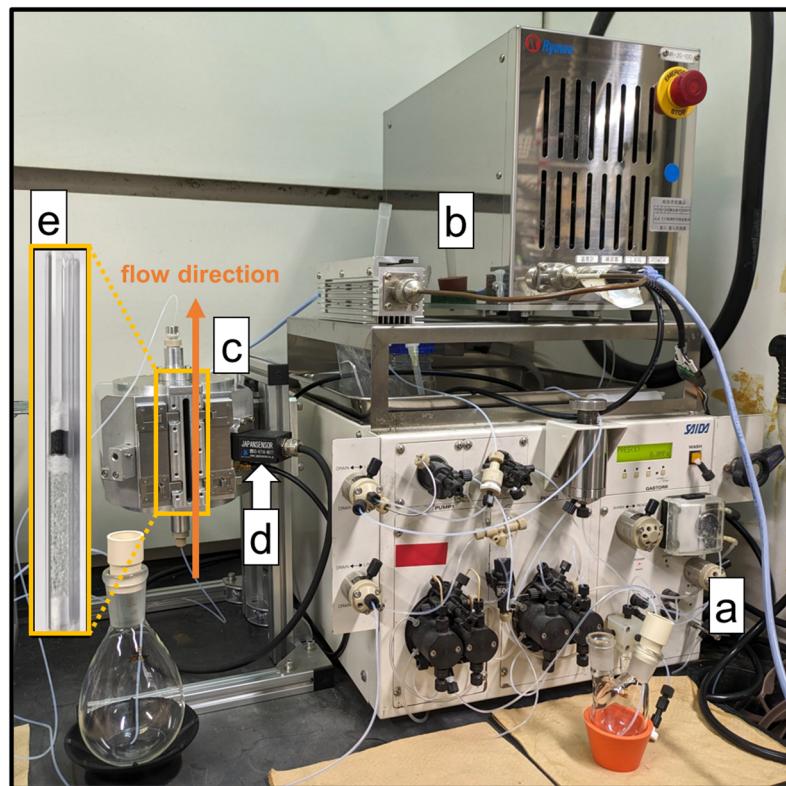

Figure. S1 The microwave flow reactor (EYELA, MR-2G-100) (a) pump, (b) Microwave controller unit, (c) Microwave generator unit, (d) Thermography unit, (e) 5% Pt/CB-packed Quartz tube (catalyst cartridge)

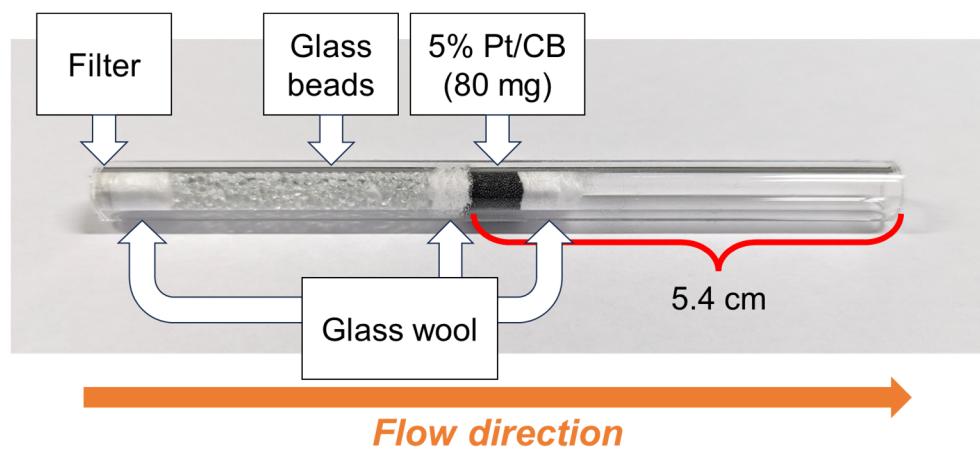

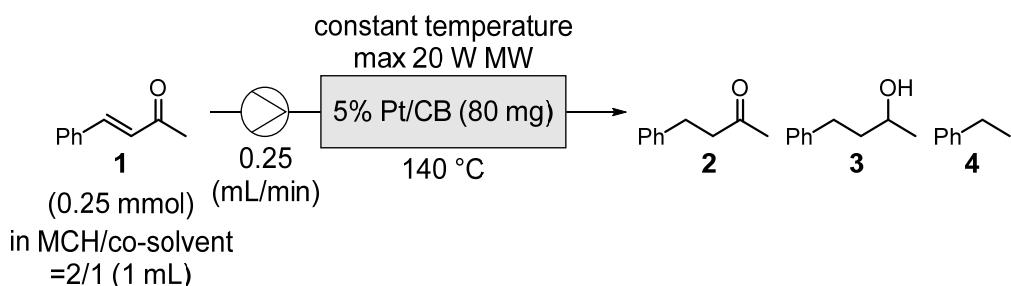

Figure. S2 The quartz tube for the continuous flow microwave reactor (EYELA, MR-2G-100)
Preparation of 5% Pt/CB-packed cartridge

Glass beads and glass wool were put on the glass filter inside an EYELA quartz reaction tube to a depth of 5.4 cm from the top to the quartz tube. 5% Pt/CB (80.0 mg) was tightly filled on the glass wool by tapping the tube, and another glass wool was then placed on the catalyst to prevent movement of the 5% Pt/CB from the cartridge.

2. Optimization of the MW-mediated continuous-flow hydrogenation reaction conditions

Table S1. The effect of co-solvent on MW-mediated continuous-flow hydrogenation reaction

Entry	Co-solvent	Product ratio ^a
		(1 : 2 : 3 : 4)
1	Toluene	2 : 78 : 0 : 20
2	<i>o</i> -Xyrene	94 : 3 : 0 : 3
3	<i>n</i> -Heptane	86 : 8 : 0 : 6
4	2-PrOH	39 : 54 : 0 : 7
5	1-Butanol	60 : 30 : 0 : 10

^a The product ratio was determined by GC-FID using decane as the internal standard.

The ratio of the formation of **4** relative to **2** was efficiently suppressed in the case using 2-PrOH as a co-solvent.

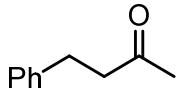

3. Thermographic measurements of the temperature of a 5% Pt/CB-packed cartridge (Figure 2)

Thermographic measurements were conducted to monitor the temperature of a quartz cartridge packed with 5% Pt/CB (80 mg) in an MW cavity (heater) mechanically set at 140 °C with the slit open. An MCH solution of **1** (0.05 M) was pumped for 30 minutes, after which the temperature of the catalyst layer was measured using thermography. The same procedure was followed for the MCH / 2-PrOH = 19 / 1 solution of **1** (0.05 M). This observation is illustrated in Figure 2.
