

Table S1. ANOVA of grain yield and quality of 18 wheat varieties under nitrogen application.

Factor	Grain yield	Total protein	Albumin	Globulin	Prolamin	Glutelin
Cultivar(C)	89.62**	295.932**	67.498**	14.442**	42.787**	36.098**
NFA	26.45**	237.949**	1.726	0.373	6.706**	38.738**
C×NFA	6.22**	18.150**	10.656**	3.592**	3.933**	10.850**
Factor	Amylose	Amylopectin	Development Time	Stable Time	[Phytate]: [Fe]	[Phytate]: [Zn]
Cultivar(C)	7.390**	4.176**	69.565**	57.884**	69.565**	57.884**
NFA	63.343**	0.162	24.123**	3.860*	24.123**	3.860*
C×NFA	2.566**	3.366**	8.112**	5.257**	8.112**	5.257**

Note: The results in the table are F-values. \* and \*\*, significant at 0.05 and 0.01 probability level, respectively. NFA: foliage application of nitrogen. [Phytate]: [Fe] and [phytate]: [Zn] represent the molar ratios of the trace elements to phytic acid.

Table S2. Effects of NFA on Fe, Zn and Phytate content of 18 varieties

Cultivars	Fe					Zn					Phytate
