6      Experimental Soil ([Table S1](#))

7      Table S1 presents the physicochemical characteristics of the soils utilized in the pot experiment, with the soils  
 8      named based on their collection site. Prior to thorough mixing of soil sample, all of the samples underwent the removal  
 9      of stones, animal, and plant residues. Each pot of soil weighed no less than 20 kg. Upon adding the soil to the pots, a  
 10     base fertilizer (2.8 g per pot, N-P-K balanced compound fertilizer) was applied. There were 12 pots in each group,  
 11     resulting in a total of 36 pots across three groups. Following soil preparation and potting, water was added to fully  
 12     saturate the soil. The soil surface was submerged to a depth of 5 cm, and the soil was allowed to stabilize for 20 days  
 13     to ensure complete dissolution of the base fertilizer, with the water depth maintained at 5 cm throughout. Monitoring  
 14     of the soil redox potential ( $E_h$ ) commenced on the 21<sup>st</sup> day of the stabilization period (prior to transplanting), and  
 15     seedlings were transplanted on the 22<sup>nd</sup> day of the stabilization period.

**Table S1** Physics and Chemistry Characteristics of Test Soil.\*

Site	pH (H <sub>2</sub> O)	SOM <sup>a</sup>	CEC <sup>b</sup>	Cd <sup>c</sup>	Pb <sup>c</sup>	Zn <sup>c</sup>	Fe <sup>c</sup>	Mn <sup>c</sup>	Ca <sup>c</sup>	Mg <sup>c</sup>

\* The basic physicochemical indexes of soil are presented in the accompanying table as  $\bar{X} \pm SD$ .

<sup>a</sup> The unit for SOM concentration is g/kg.

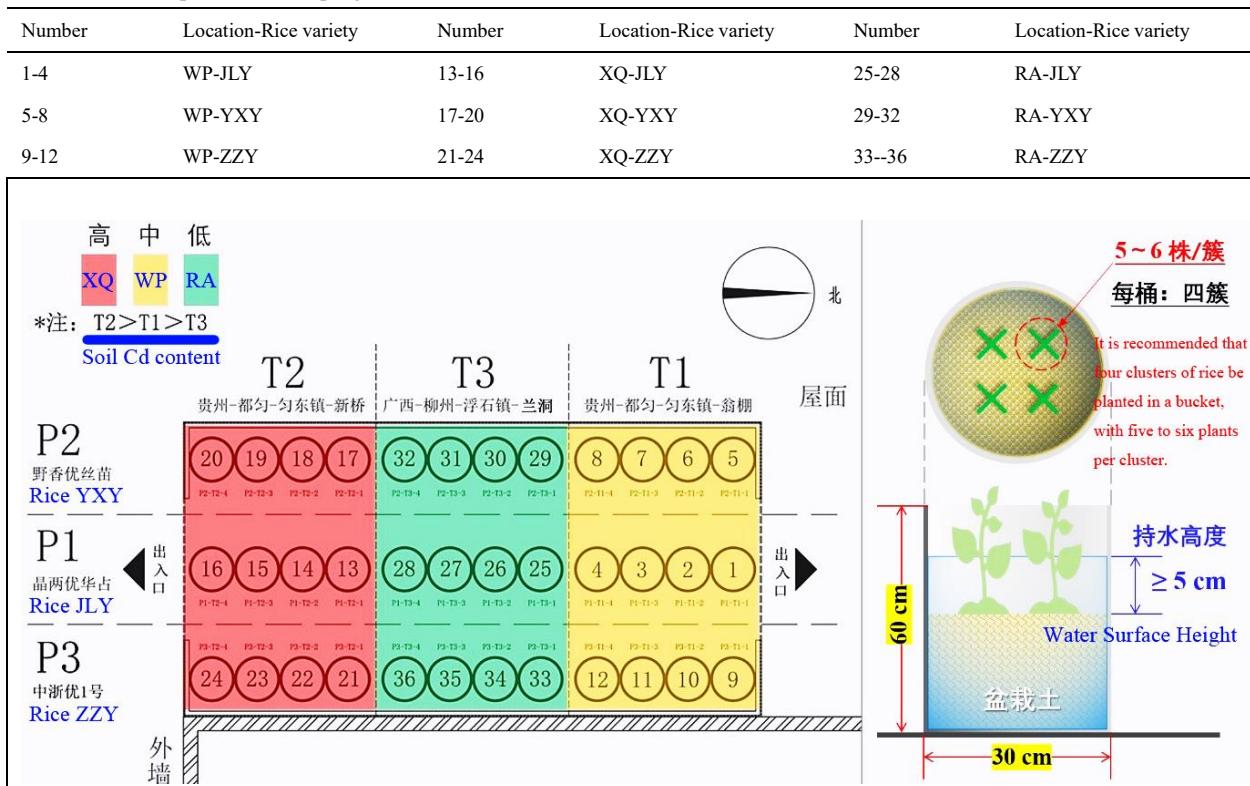

<sup>b</sup> The unit for CEC concentration is cmol<sup>+</sup>/kg.

<sup>c</sup> The unit for metal elements (Cd, Pb, Zn, Fe, Mn, Ca, and Mg) concentration are mg/kg.

## 17 Experimental Design (Table S2)

18 Table S2 provides an overview of the grouping arrangement for the pot experiments conducted in the greenhouse.  
 19 At the time of transplanting, four seedlings were planted in each hole. For each rice variety, four parallel experiments  
 20 were carried out using each group of test soils. Following transplanting, the soil surface remained submerged by water  
 21 until the completion of the rice blooming period, which occurred on the 60<sup>th</sup> day after transplanting. From the grain-  
 22 filling period onwards, water management was implemented using a wet-dry cycle until the rice reached the fully ripe  
 23 stage on the 80<sup>th</sup> day after transplanting. Additionally, supplementary basal fertilizer (1.2 g per pot) was applied as the  
 24 plants approached the booting stage, occurring on the 30<sup>th</sup> day after transplanting. A foliar fertilizer ( $\text{KH}_2\text{PO}_4$ )  
 25 application was administered once at the heading stage, occurring on the 60<sup>th</sup> day after transplanting.

**Table S2** Pot Experiment Grouping.

26

**Process Photographs of the Pot Experiment.**

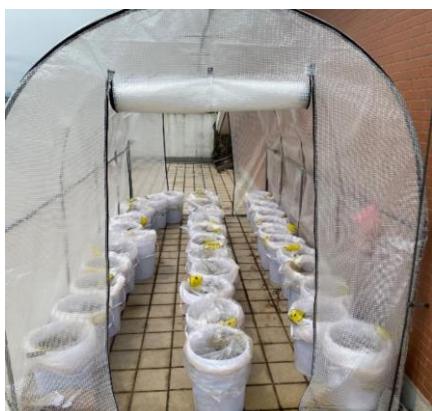

(1) The soil samples used in the pot experiment were collected from the field.

(2) The preliminary procedure for the potting experiment soil.

(3) Rice seedlings (Phase 1).

(4) Potting soil already prepared.

(5) Fill the potting soil with water to begin soaking it (Phase 1).

(6) Soil redox potential monitoring (Phase 2).

(7) Prior to transplanting rice, screen out rice seedlings.

(8) One week after transplanting rice.

(9) Tillering stage of rice (Between Phase 2 and Phase 3).

(10) Full heading stage of rice (Phase 4).

(11) Full ripe stage of rice (Phase 5).

(12) Collection of whole rice plants (Phase 4 and Phase 5).

(13) Collection of soil samples at each phase of rice growth ( $\geq 1$  kg/bag).

**Table S3** Basic Form of the Metabolic Mechanism Model (second-order polynomial).

**Table S5** Screening Results of Stepwise Regression.<sup>e</sup>

Model description <sup>a</sup>	Dependent variable ( $y$ )	Model number	$P_F$ <sup>b</sup>	Independent variable ( $x$ )	$P_T$ <sup>c</sup>	VIF <sup>d</sup>
				$x_3x_6$	0.072	66.55

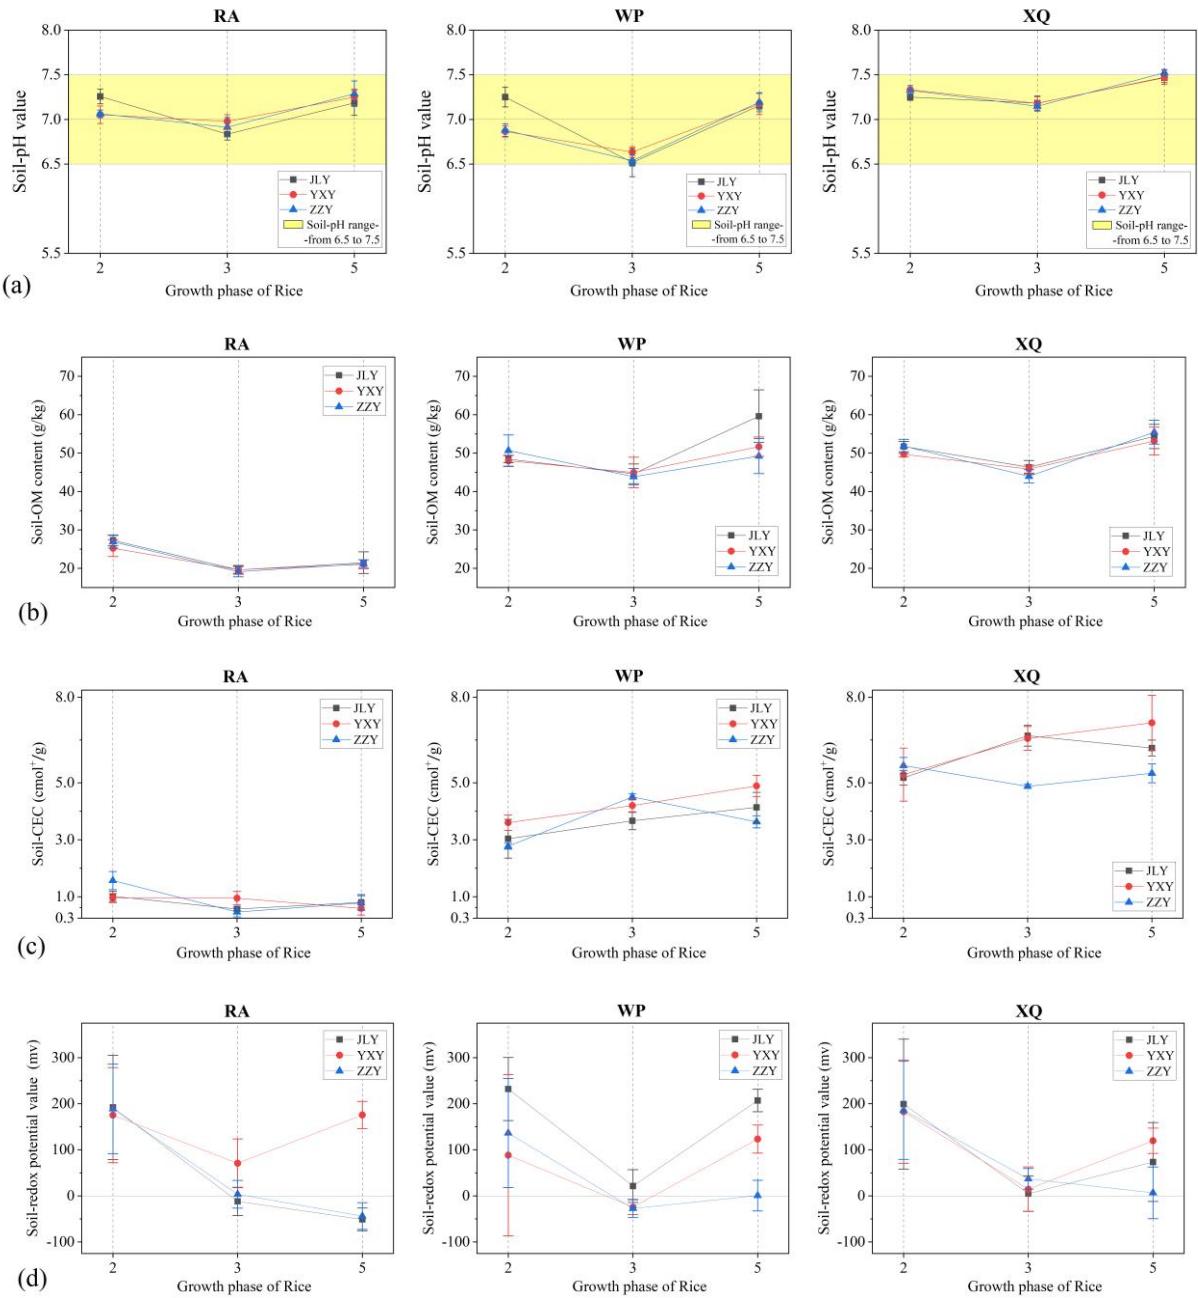

<sup>a</sup> The model description of the table provides a basic overview of the models, which is included three parts: (i) the location of the test soil, (ii) the indicator name, and (iii) the corresponding heavy metal element.

<sup>b</sup> The  $P_F$  represents the significance level of the F-test.

<sup>c</sup> The  $P_T$  represents the significance level of the T-test.

<sup>d</sup> The VIF represents the value of the Variation Inflation Factor.

<sup>e</sup> The table's green background represents the optimal subset of models.

**Figure S1.** Basic Physicochemical Index of Test Soil During the Rice Growth Process. The X-axis represents the time nodes of the rice growth process in all pictures. "2" denotes the transplanting stage, "3" denotes the booting stage, and "5" denotes the full ripe stage.

**Table S6** Soil Physicochemical Index During the Critical Phase of Rice Growth.\*

Location name <sup>a</sup>	Index name	Phase 2 <sup>b</sup>	Phase 3 <sup>b</sup>	Phase 5 <sup>b</sup>
RA (n=36)	pH	7.12±0.12 b	6.91±0.10 c	7.24±0.12 a
	Soil-OM (g/kg)	26.5±1.8 a	19.4±1.1 c	21.2±1.7 b
	CEC (cmol <sup>+</sup> /g)	1.00±0.44 a	0.609±0.26 b	0.672±0.29 b
	E <sub>h</sub> (mv)	185±95 a	20.8±52 b	27.0±113 b
WP (n=36)	pH	7.00±0.20 b	6.56±0.11 c	7.17±0.088 a
	Soil-OM (g/kg)	49.0±2.6 b	44.5±2.8 b	56.9±15 a

	E <sub>h</sub> (mv)	189±110 a	18.8±37 b	66.6±73.5 b

\* The significance of differences between data was tested using Duncan's method ( $p < 0.05$ ). The data were classified according to soil collection location and compared within each soil Indexes during three critical phases of rice growth.

<sup>a</sup> "n" represents the number of samples.

<sup>b</sup> Phase 2 represents the rice transplanting stage, Phase 4 represents the full heading stage, and Phase 5 represents the full ripe stage.

**Table S7** Metabolic Properties of Various Metals in Rice Plants at the Maturation Stage.\*
