

Supplementary Figure S2. A) Macroscopic observation of the distal regions of colons from DSS-, AOM- and AOM/DSS-treated mice at the end of the 12th week (1 colon per group is shown). Evident macroscopic lesions detectable only in AOM/DSS-treated colons. **B)** Hematoxylin/eosin staining of tumors and normal colons. Colon mucosae of AOM-only and DSS-only treated mice show normal histological characteristics. Adenocarcinomas with a high degree of dysplasia are detectable in AOM/DSS-treated mice. 20x original magnification. Scale bars, 50 μ m.
