

**Supplemental Figure S1.** Setting up an AVG-independent plate system for *Medicago truncatula* nodulation. **(A)** Schematic representation of three tested inoculation systems; “Shoots out” of the plate, “Shoots in” the plate and shoots in the plate with roots “Covered” by aluminum foil. **(B)** Effect of the “Shoots out” and “Shoots in” system on nodulation on plates. AVG used as a positive control. **(C)** Effect of root covering on nodulation on plates **(B-C)** 14 Days Past Inoculation, bars represent means  $\pm$  SE (n=40).

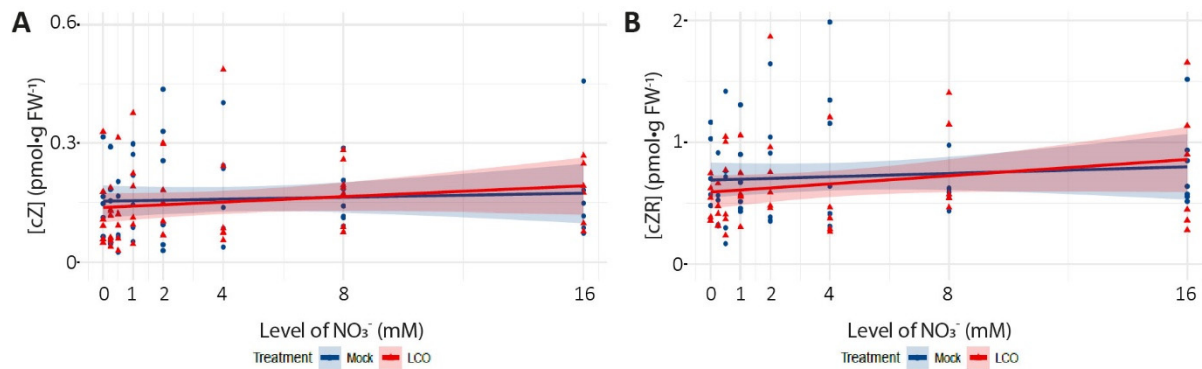

**Supplemental Figure S2:** Nitrate inhibition of nodulation on Fåhræus plates. **(A)** Schematic representation of the increase in nitrate levels. **(B)** Effect of increasing levels of nitrate on primary root growth 5 DPG (days post Germination). **(C)** Effect of nitrate on nodulation on plates at 14 DPI. Bars represent means  $\pm$  SE (n=40).

**Supplemental Figure S3.** Root hair deformation is not affected by elevated levels of nitrate. **(A-H)** LCO-induced root hair deformation at increasing levels of nitrate **(I-P)** Mock-treated roots at increasing levels of nitrate, these pictures are representative of 10 biological replicates divided over two independent experiments. **(Q)** the effect of increased nitrate on primary root growth 2 DAG (days after germination). Bars represent means  $\pm$  SE (n=10).

**Supplemental Figure S4:** The effect of increasing levels of nitrate on iPR and tZR accumulation in the *Medicago* root susceptible zone. Concentrations of **(A)** iPR, **(B)** tZR, were measured per gram fresh weight using UPLC-MS/MS ( $n=6$ ) in samples taken from the root susceptible zone and treated with mock or LCO for 3 h.

**Supplemental Figure S5:** The effect of increasing levels of nitrate on cZ and cZR accumulation in the *Medicago* root susceptible zone. Concentrations of **(A)** cZ, **(B)** cZR, were measured per gram fresh weight using UPLC-MS/MS ( $n=6$ , ) in samples taken from the root susceptible zone and treated with mock or LCO for 3 h.

**Supplemental Table S1.** Sequences and primers used in this study (*M. truncatula* genome v4.01)

Primer name	Sequence	Gene ID
MtACD_Fw	AAACAAAGTGC GGAAATTGG	Medtr8g107670
MtACD_Rv	GGGATCTTGGTCAACGAGAA	
MtNIN_Fw	GGGAGAAAGTCCGGGGACAA	Medtr5g099060

\*Mass in positive (+) ion mode. ‡transition used for quantification

**Supplemental Table S3.** AIC scores for various GAM models of NIN expression. Row names indicate which factors were included in the model. Lower AIC score indicates better model fit.

	df	AIC
<i>Intercept</i>	2	536.151
$NO_3^-$	3	536.461
<i>LCO</i>	3	465.644
$NO_3^- + LCO$	9.848	411.748

**Supplemental Table S4.** Linear model coefficients with 95% confidence intervals and p-values. Modeling the relationship between concentration of six different cytokinins,  $NO_3^-$  concentration and LCO application. Model specification: Cytokinin  $\sim NO_3^- + LCO + NO_3^- : LCO$ .

	cZ	cZR	iP	iPR	tZ	tZR
