

Figure S2. The fertility of *D. melanogaster* wild type strain Bi90 in comparison with variations of barometric pressure in Novosibirsk, Russia, in the end of July of 2020 (<https://www.wunderground.com/history>). Each point represents an average value of 10 tests (N=3 for each test) as means \pm s.e.m. The asterisks illustrate the post-hoc differences in comparison with the fertility level on previous day. One asterisk indicates $p<0.05$; two asterisks, $p<0.01$; three – $p<0.001$.
