

Figure S1

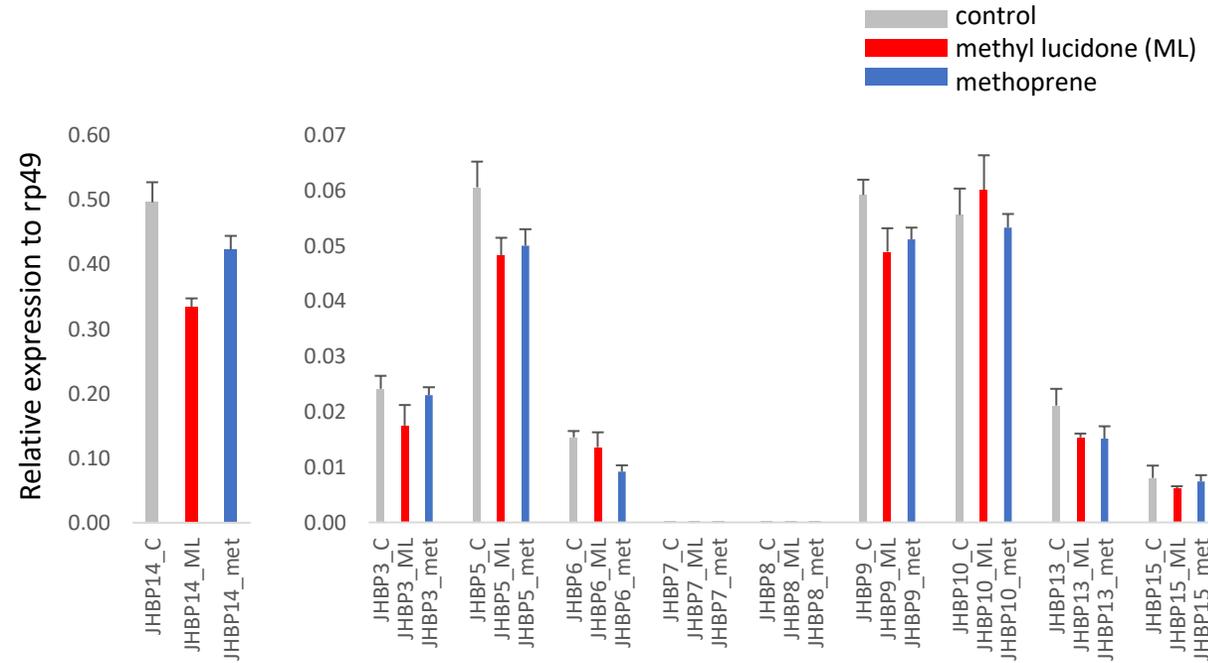

Figure S1. Ten *D. melanogaster* JHBP genes are not inducible by ML and methoprene at the 2nd instar larval stage. The gene expression was evaluated by qPCR with gene-specific primers. We show two figures with different scales of the Y-axis to clarify the expression level of each JHBP gene: the left figure depicts the relatively high abundance of JHBP14; the one on the right shows the relatively low abundance of the other nine JHBP genes. Two independent biological replicates showed that these 10 JHBP genes are not induced, and a representative result is presented. Each result shows the average value of three replicates during the RNA isolation and qPCR steps, and the error bars indicate standard deviation.

Figure S2

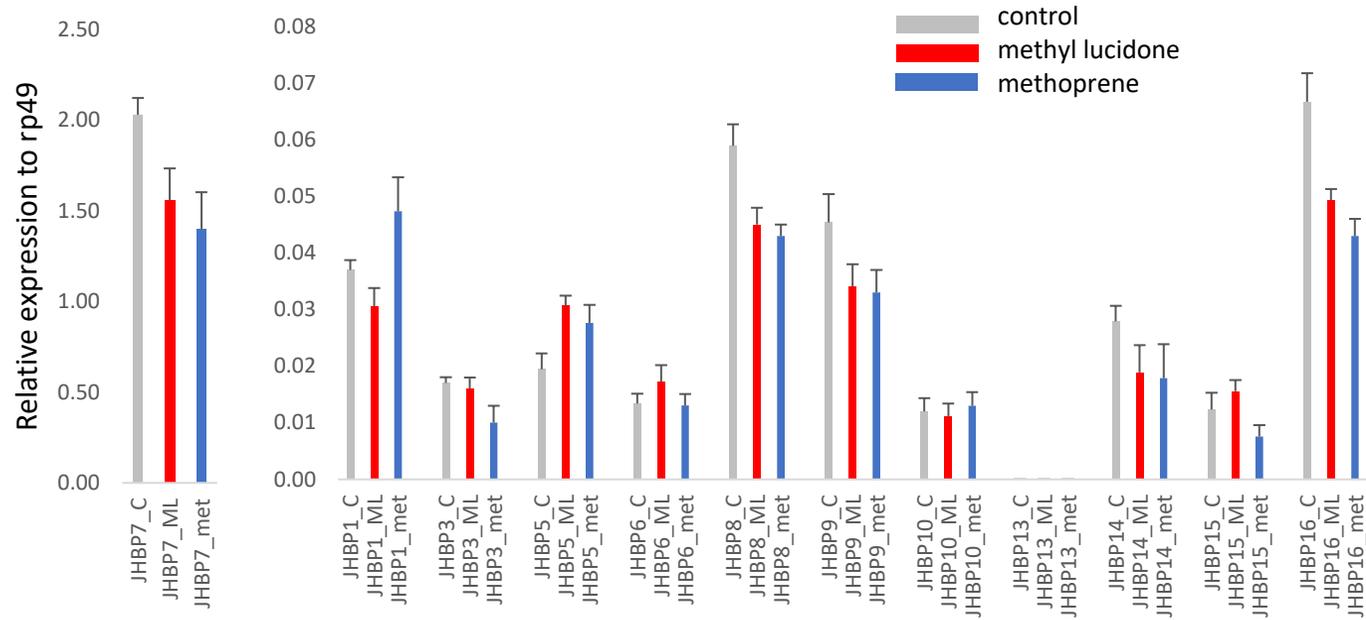

Figure S2. The expression of 12 *D. melanogaster* JHBP genes remains unchanged by ML and methoprene at the pupal stage. The gene expression was evaluated by qPCR with gene-specific primers. The figure has been split into two with different scales of the Y-axis for a clearer representation of the expression level of each JHBP gene: the left figure demonstrates the relatively high abundance of JHBP7; the one on the right shows the relatively low abundance of the remaining 11 JHBP genes. Two independent biological replicates show that JHBP gene-expression levels remain unchanged, and a representative result is presented. Each result shows the average value of three replicates during the RNA isolation and qPCR steps, and the error bars indicate standard deviation.
