Figure S1: Data of the study population, with median or mean per item.

Demographical data contain, beside age and gender, also data on family relationships as far as could be obtained.

Brushing frequency and smoking are self-reported data and may be subjected to bias.

CPI is recorded with 0 as minimum and 4 as maximum.

DMFT is recorded on the basis of the number of teeth present, since tooth loss due to trauma, periodontitis or caries could not be differentiated.

Aa is the concentration *A. actinomycetemcomitans* in plaque or saliva as given in Log CFU/sample or Log CFU/mL respectively

*Means that these concentrations are for the JP2 genotype.
