

## Supplementary figures

Suppl. Figure S1. Phylogenetic tree of HA segment of H3Nx avian influenza viruses obtained

from seals (marked in red) and representative wild bird population. A full-length HA segment

of H3Nx seal and wild bird isolates available in the GISAID (n= 1840) were retrieved and representative sequences (n= 256) were selected based on sequence identity at 97% level using CD-HIT package. The wild bird isolates that clustered with a seal isolates (n=38) were selected to generate phylogenetic tree. The nucleotide sequences of complete HA segments were aligned using MUSCLE on MEGA 11.03.13. GTR nucleotide substitution model, with among-site rate variation model using a discrete gamma distribution. Bootstrap support values were generated using 500 rapid bootstrap replicates.

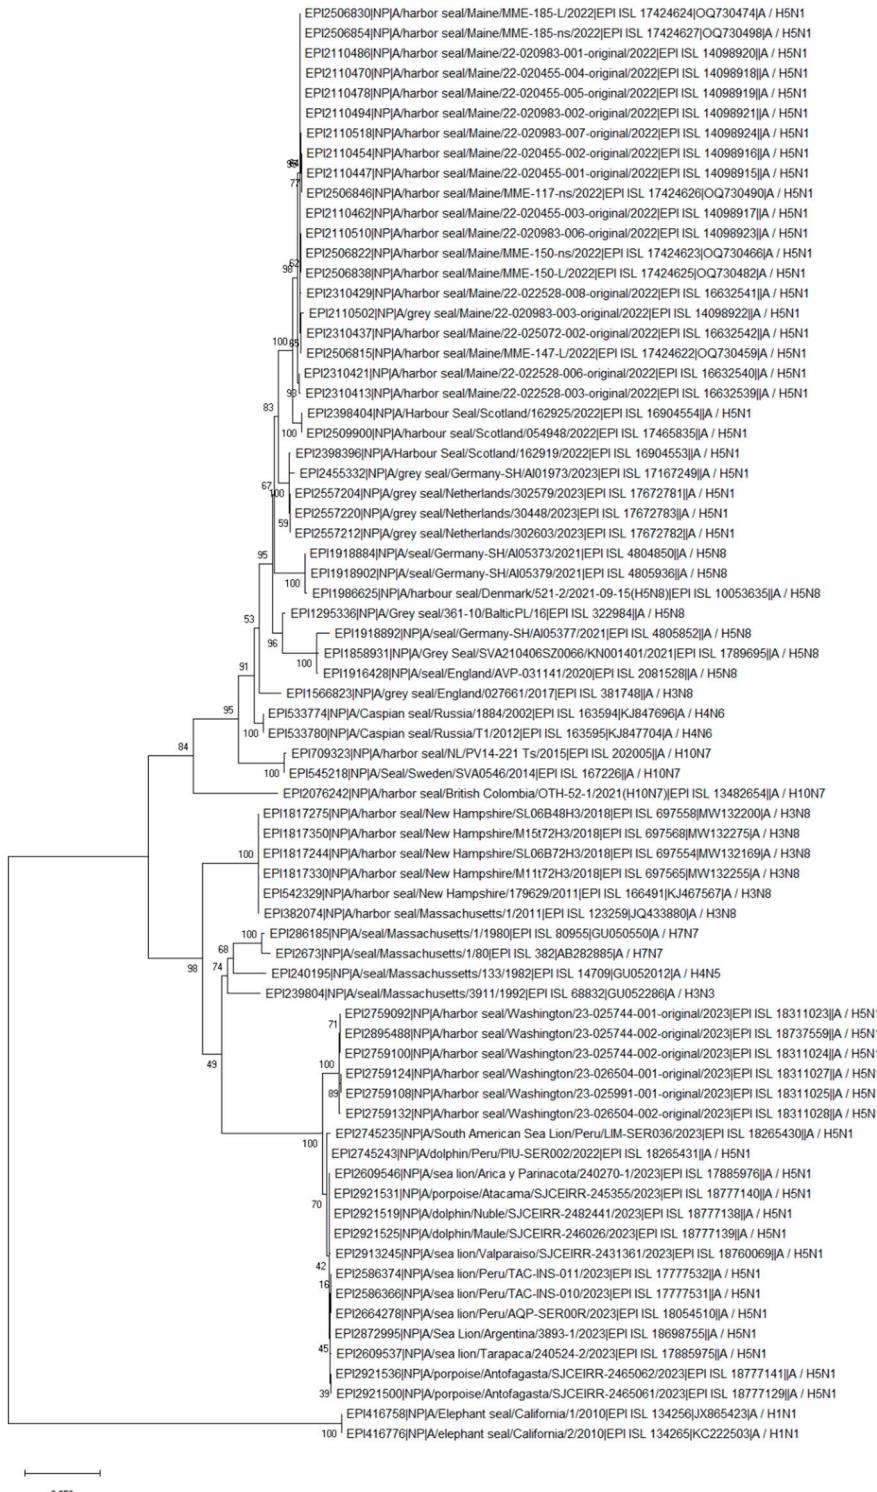

Suppl. **Figure S2.** Phylogenetic tree of NA segment of HxN3 avian influenza viruses obtained from seal (red dot) and representative wild bird population. The representative sequences (n= 181) were selected based on sequence identity at 97% level using CD-HIT package out of all HxN3 isolates available in GISAID. The viral isolates that clustered with a H3N3 seal isolate (n=51) were selected to generate a phylogenetic tree. The nucleotide sequences of the NA segment were aligned using MUSCLE. GTR nucleotide substitution model, with an among-site rate variation model using a discrete gamma distribution. Bootstrap support values were generated using 500 rapid bootstrap replicates.

Suppl. Figure S3. Avian influenza virus PB2 protein alignment of all available strains

obtained from marine mammals in the last 45 years. The PB2 amino acid position at 627 and 701 is highlighted in yellow. The substitution E627K and D701N in PB2 segment is frequently observed in AIVs isolated from mammals.

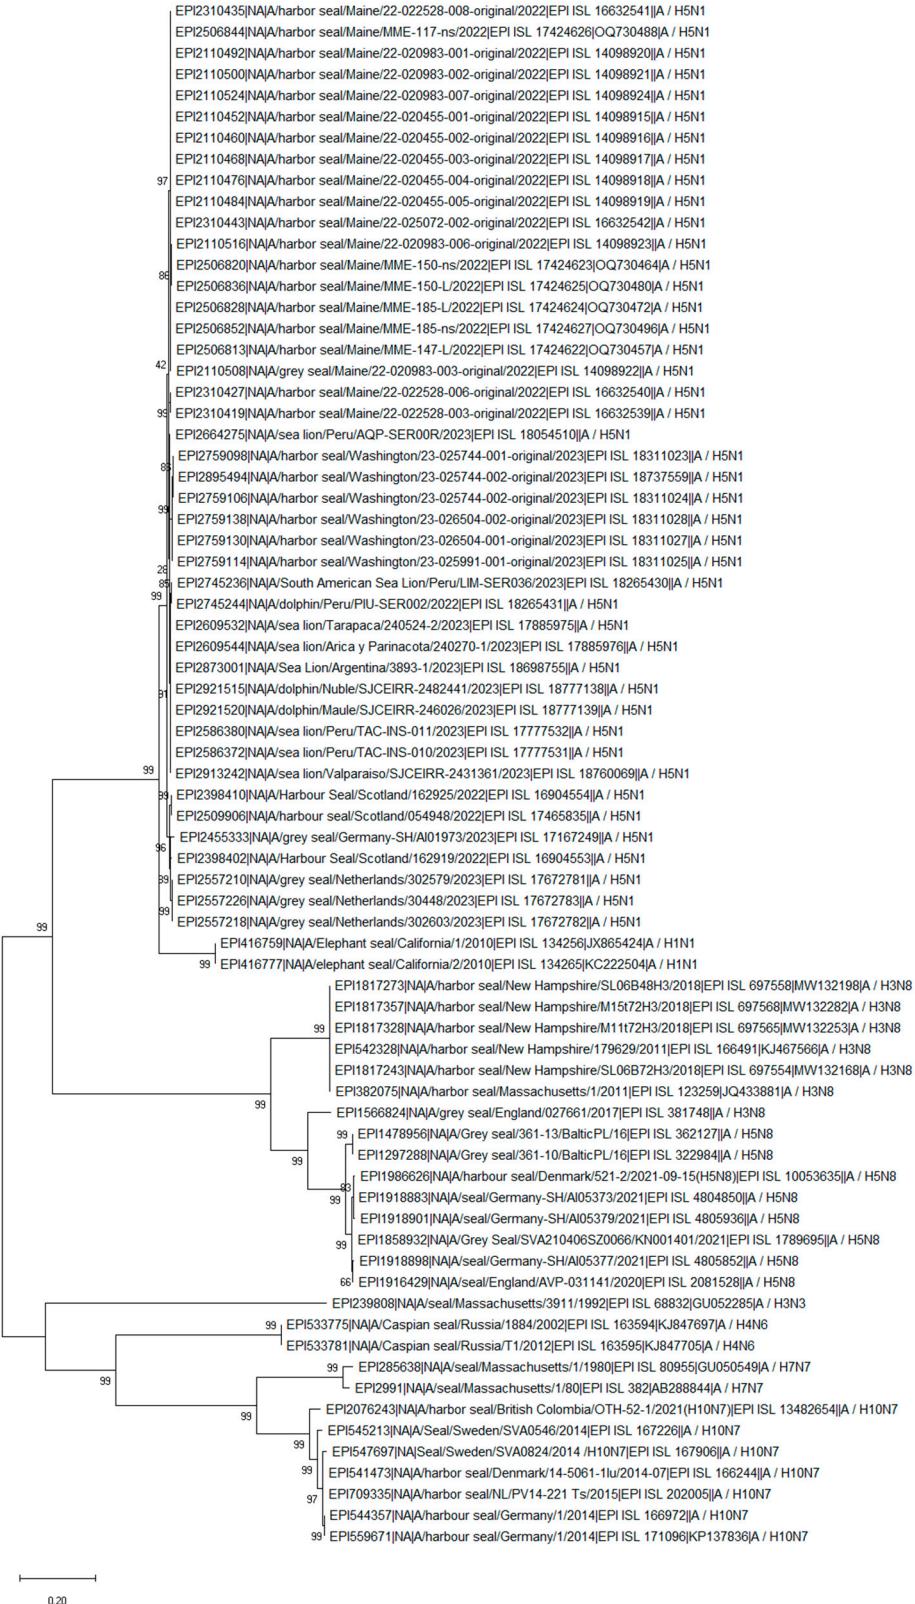

**Suppl. Figure S4.** Phylogenetic tree of NP segment of avian influenza viruses found in seal population over the last 45 years. The analysis includes seal isolates of different avian influenza subtypes isolated between 1980-2023 along with current H5N1 clade 2.3.4.4b viruses from 8 sea lions, 3 dolphins and 3 porpoises available in GSAID (as of March 2024). The nucleotide sequences of the NP segment were aligned using MUSCLE and MEGA 11.03.13.

The General Time Reversible (GTR) nucleotide substitution model, with among-site rate variation model using a discrete gamma distribution. Bootstrap support values were generated using 500 rapid bootstrap replicates.

Suppl. **Figure S5.** Phylogenetic tree of HA segment of avian influenza viruses found in seal population over the last 45 years. The analysis includes seal isolates of different avian influenza subtypes isolated between 1980-2023 along with current H5N1 clade 2.3.4.4b viruses from 8 sea lions, 3 dolphins and 3 porpoises available in GSAID (as of March 2024). The nucleotide sequences of the HA segment were aligned using MUSCLE software. The General Time Reversible (GTR) nucleotide substitution model, with among-site rate variation model using a discrete gamma distribution. Bootstrap support values were generated using 500 rapid bootstrap replicates.

Suppl. Figure S6. Phylogenetic tree of NA segment of avian influenza viruses found in seal

population over the last 45 years. The analysis includes seal isolates of different avian influenza subtypes isolated between 1980-2023 along with current H5N1 clade 2.3.4.4b viruses

from 8 sea lions, 3 dolphins and 3 porpoises available in GSAID (as of March 2024). The nucleotide sequences of the NA segment were aligned using MUSCLE software and GTR nucleotide substitution model, with an among-site rate variation model using a discrete gamma distribution. Bootstrap support values were generated using 500 rapid bootstrap replicates.

**Suppl. Figure S7. Phylogenetic tree of NS segment of avian influenza viruses found in seal population over the last 45 years. The analysis includes seal isolates of different avian influenza subtypes isolated between 1980-2023 along with current H5N1 clade 2.3.4.4b viruses**

from 8 sea lions, 3 dolphins and 3 porpoises available in GSAID (as of March 2024). The nucleotide sequences of the NS segment were aligned using MUSCLE software and GTR nucleotide substitution model, with an among-site rate variation model using a discrete gamma distribution. Bootstrap support values were generated using 500 rapid bootstrap replicates.

## Supplementary Tables

Suppl. **Table S1**. The percentage of identity (%) between the haemagglutinin (HA) of A/seal/Massachusetts/133/1982 H4N5 and representative H4Nx influenza viruses from wild birds. All full-length HA segments of H4Nx bird isolates available in the GISAID (n= 3023) were retrieved and representative sequences (n= 189) were selected based on sequence identity at 97% level using CD-HIT package. Next, the wild bird isolates (n=70) that clustered with H4N5 seal isolates were aligned with A/seal/Massachusetts/133/1982 H4N5 and the percentage of similarity calculated using Geneious Prime software.

Suppl. **Table S2.** Estimates of Evolutionary Divergence between the hemagglutinin (HA) of H3Nx seal and wild bird isolates. The number of base substitutions per site from between sequences are shown. Analyses were conducted using the Maximum Composite Likelihood model. This analysis involved 38 nucleotide sequences. All ambiguous positions were removed for each sequence pair (pairwise deletion option). There were a total of 1889 positions in the final dataset. Evolutionary analyses were conducted in MEGA11.

Suppl. **Table S4**. Estimates of Evolutionary Divergence between the hemagglutinin (HA) of H10N7 seal and H10Nx wild bird isolates. The number of base substitutions per site from between sequences are shown. Analyses were conducted using the Maximum Composite Likelihood model. The primary analysis involved 124 representative nucleotide sequences, however to simplify the table, only sequences that showed less than 0.06 genetic distance (**bold**) to any of the seal isolates are shown here. All ambiguous positions were removed for each sequence pair (pairwise deletion option). There were a total of 1807 positions in the final dataset. Evolutionary analyses were conducted in MEGA11.
