Figure S1. Phylogenetic analysis of Yellowstone hot spring samples and Verrucomicrobiota strains by the Maximum Likelihood tree using the Tamura-Nei model of the 16S rRNA gene sequences. Accession numbers for each reference bacteria are included in parentheses in the figure.

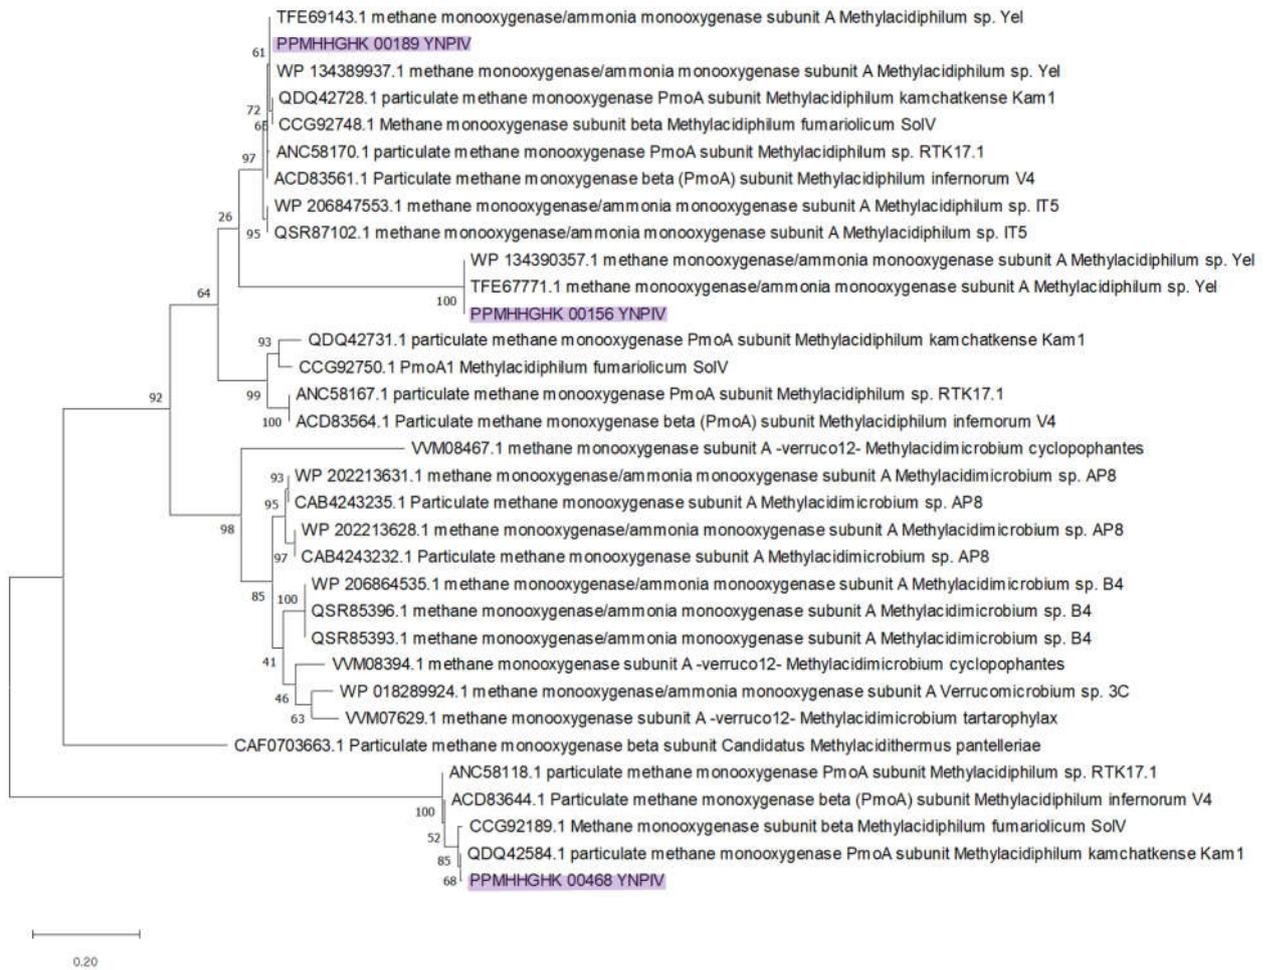

Figure S2. Phylogenetic analysis of the *pmoA* gene in YNP IV strain obtained using the Maximum Likelihood method. The tree is constructed from *pmoA* gene sequences of other references that have been obtained from the NCBI database. The percentage of trees where the associated taxa clustered together is presented next to the branches. Evolutionary analyses were conducted in MEGA-X.

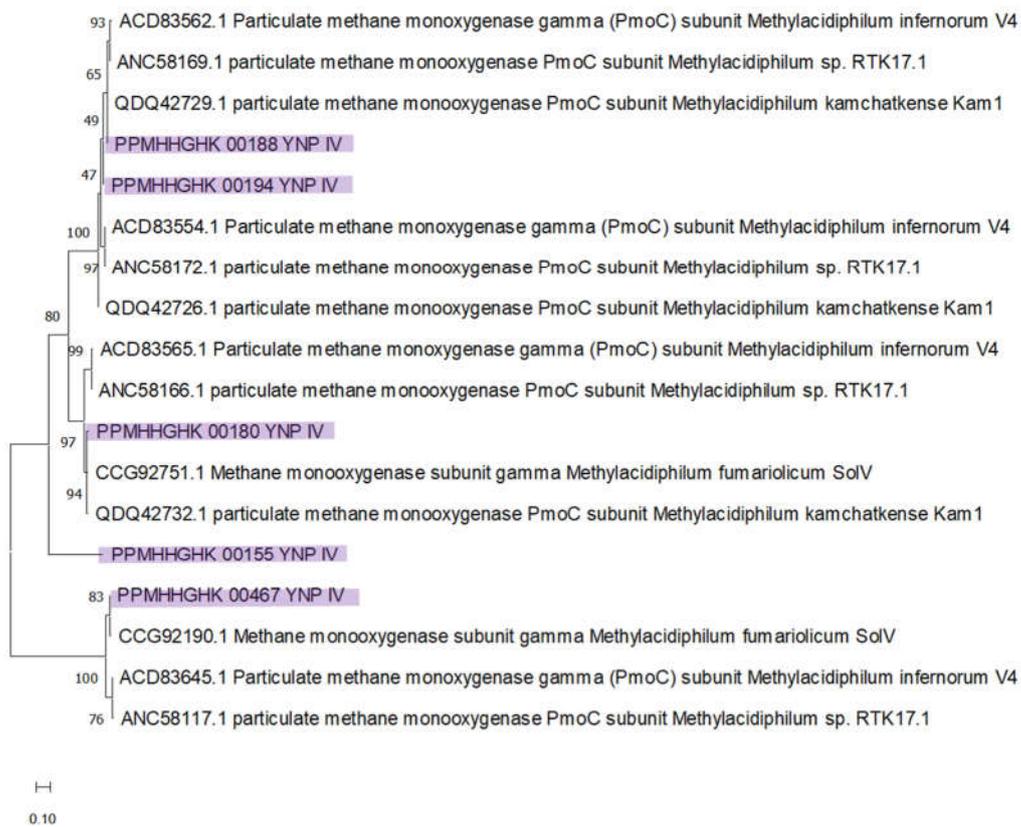

Figure S3. Phylogenetic analysis of the *pmoC* gene in YNP IV strain obtained using the Maximum Likelihood method. The tree is constructed from *pmoA* gene sequences of other references that have been obtained from the NCBI database. The percentage of trees where the associated taxa clustered together is presented next to the branches. Evolutionary analyses were conducted in MEGA-X.

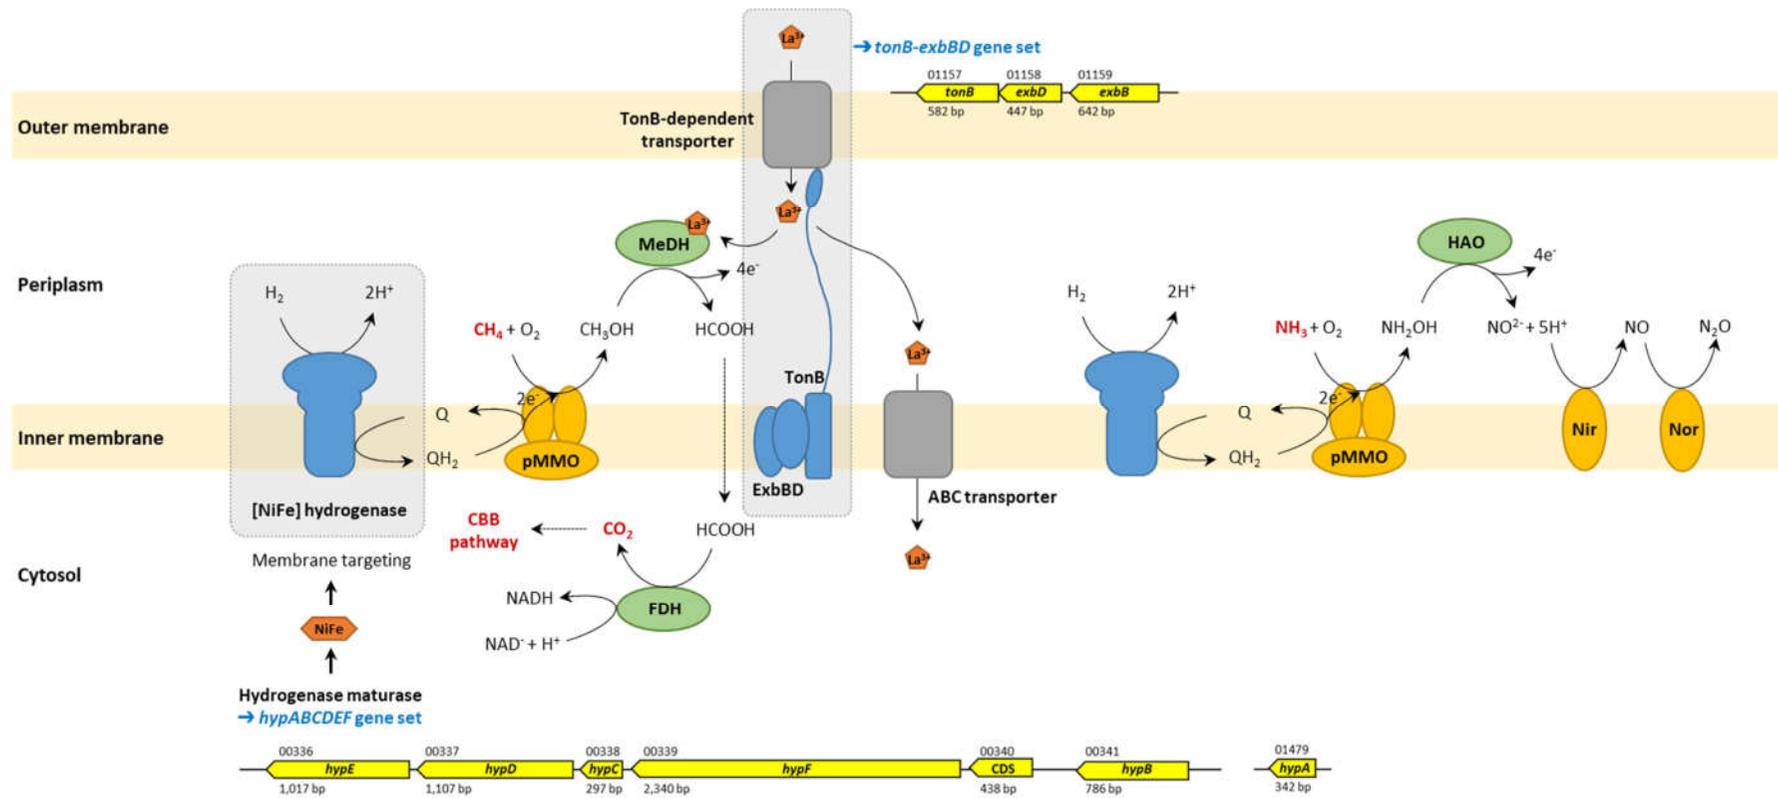

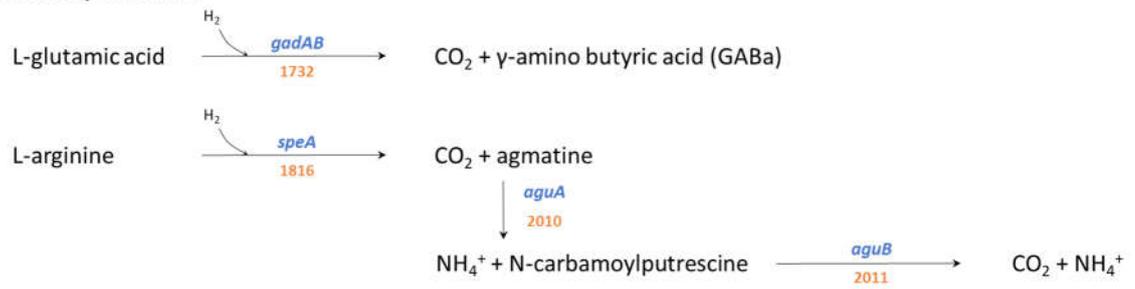

Figure S4. Hydrogenase genes related to methane and nitrogen metabolism and transportation of rare earth elements in the YNP IV. The numbers above and under the arrow are locus tag numbers without prefix (PPMHHGHK) and gene size.

(A) Proton sequestration

(B) Protection and repair of protein and DNA

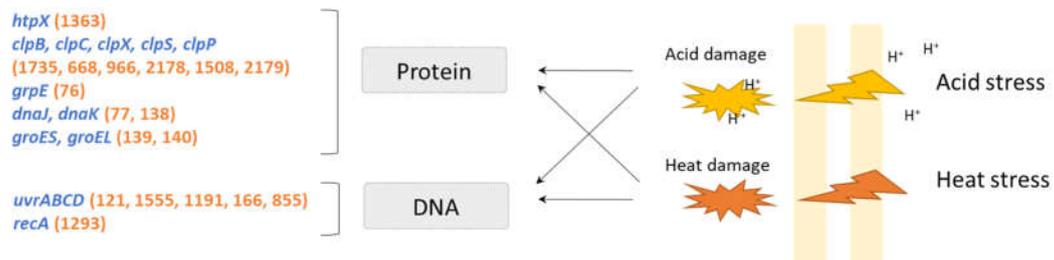

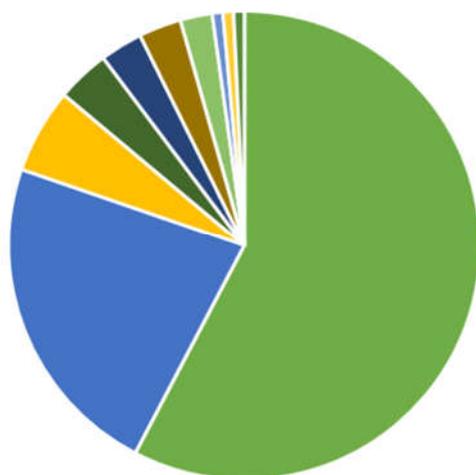

Figure S5. Acid and heat stress-associated genes in the YNP IV. (A) Proton sequestration. (B) Protection and repair of protein and DNA. Blue letters represent gene names and orange numbers indicate locus tag numbers without prefix (PPMHHGHK).

Resistance Mechanism	%
