pH	0.79***	-0.14	-0.84***	-0.81***	0.86***	0.69***	-0.53*	1

Table S3. Results of simple and Partial Mantel tests demonstrated spearman's correlations of environmental factors (Enclidean), total environmental variability (Euclidean) and geographic distance with bacterial and protistan beta-diversity dissimilarity (Bary-Curtis) against all sampled sites (n=27, with 9,999 permutations). Env referred to the Euclidean distance of the set of all environmental parameters including sa-linity, temperature, DIN, DIP, DSi, Chl *a*, SPM and pH. Geo referred to the geographic distance. r_{env} referred to the correlation coefficient between abiotic drivers and microbial dissimilarity controlled by set of all environmental parameters derived from Mantel test. r_{geo} referred to the correlation coefficient between abiotic drivers and microbial dissimilarity controlled by geographic distance derived from Partial Mantel tests. * $P < 0.05$; ** $P < 0.01$; *** $P < 0.001$.

Variation	Bacteria			Protists

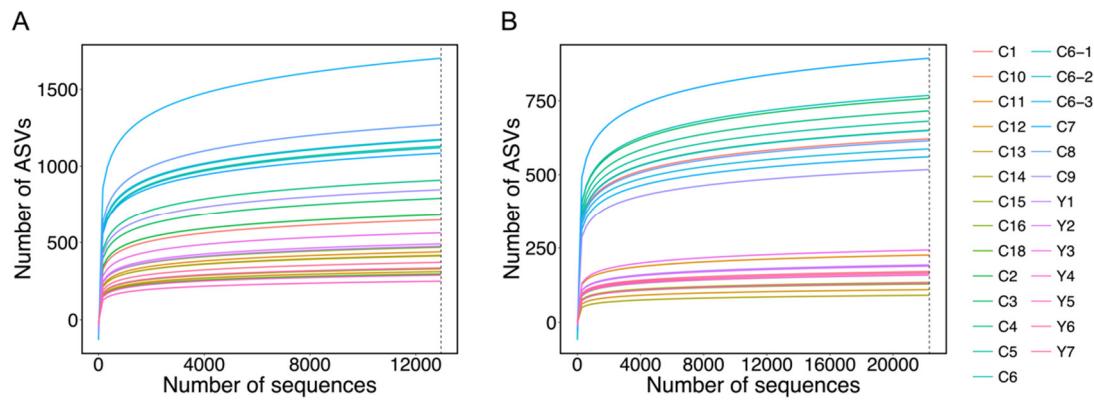

Figure S1. Rarefaction curve of bacterial (A) and protistan (B) sequencing.

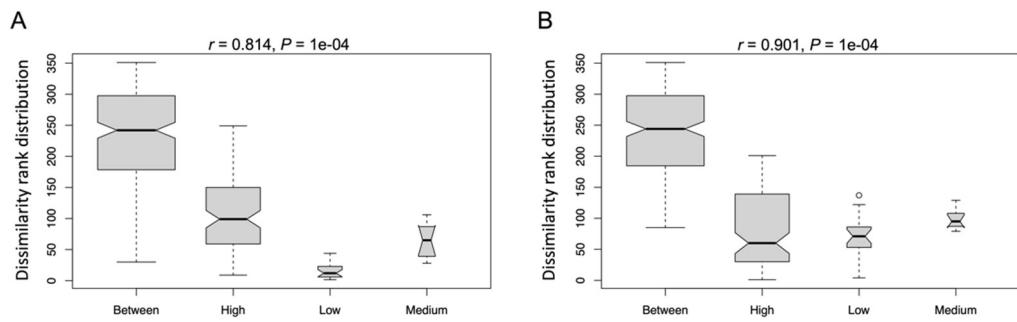

Figure S2. Analysis of similarities (ANOSIM) between different salinity groups of bacteria (A) and protists (B).

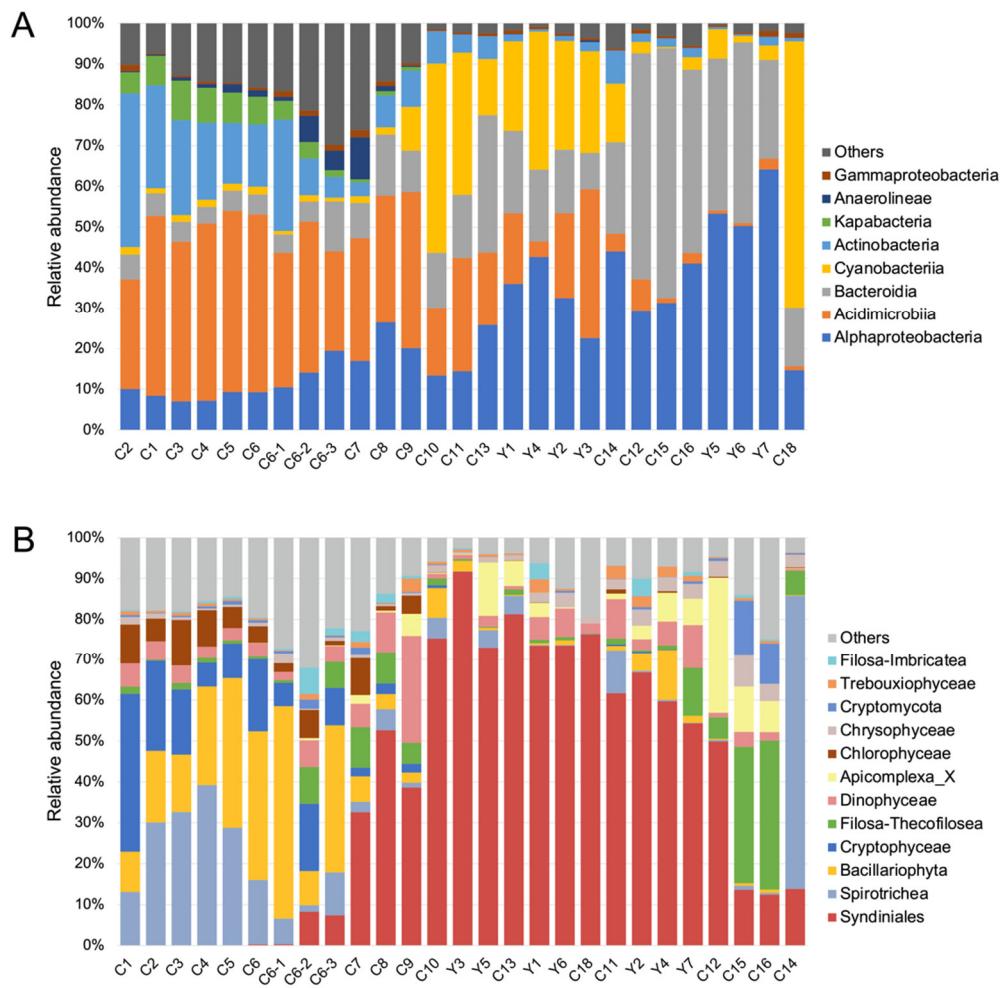

Figure S3. Community composition of bacteria (A) and protists (B) at class level in each sample, respectively. Species with low abundance were assigned to 'Others' (at least less than 1%).

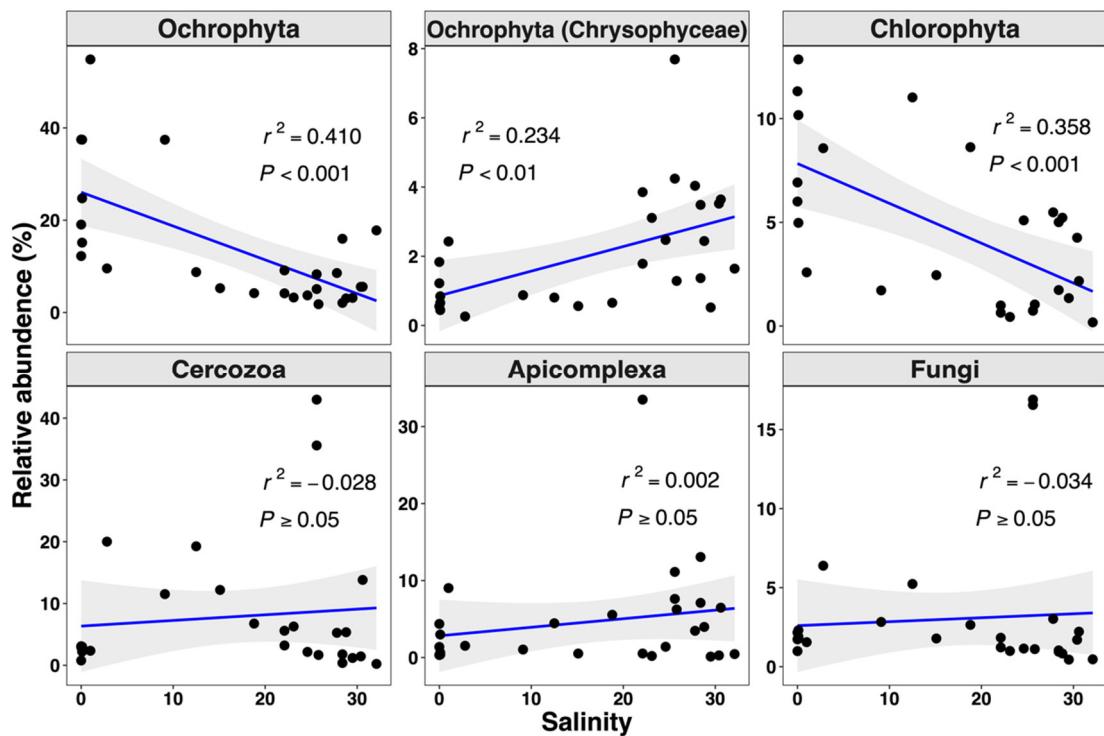

Figure S4. Scatter plots showing the relative abundance of some representative phyla(class) of protists as a function of salinity. Blue line = linear regression fit; shaded area = 95% confidence interval. r^2 and P represented the goodness-of-fit and significance, respectively.

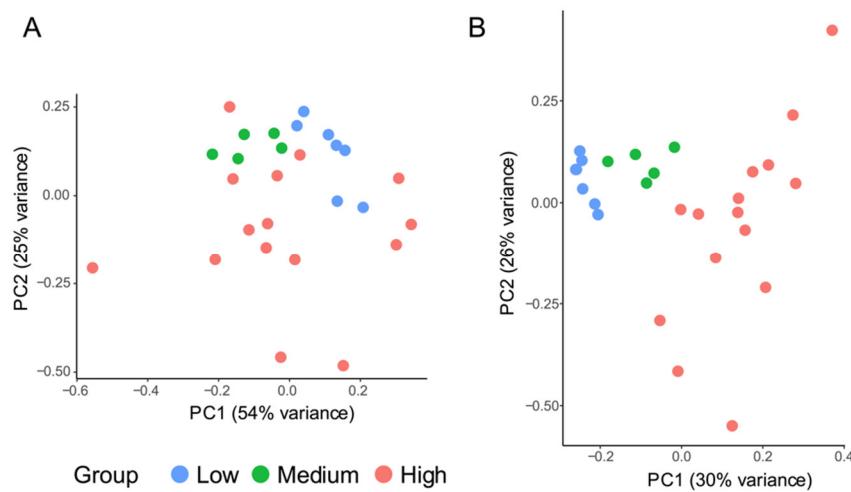

Figure S5. PCA plot based on gene functional abundance on level I (A) and III (B) of KEGG predicted by PICRUSt2. Each point represented a sample, and the color blue, green and red represented the salinity groups of Low, Medium and High, respectively.
