Table S1. Metagenomic datasets from different hypersaline habitats used for the ecological distribution analysis.

Metagenomic dataset	Sample	Salt concentration	SRA accession number	Reference
SMO1	Hypersaline soil (Huelva, Spain)	24.0 mS cm ⁻¹	SRR5753725	[66]
SMO2	Hypersaline soil (Huelva, Spain)	54.4 mS cm ⁻¹	SRR5753724	[66]
Cáhuil	Saltern crystallizer (Cáhuil, Chile)	34 % (w/v) salts	SRR1549536	[100]
Tyrrell 0.1	Hypersaline lake (Victoria, Australia)	29% (w/v) salts	SRR5637210	[104]
Tyrrell 0.8	Hypersaline lake (Victoria, Australia)	29% (w/v) salts	SRR5637211	[104]
Urmia	Hypersaline lake (Iran)	510.3 mS cm ⁻¹	SRR19434976	[105]
IC21	Saltern pond (Isla Cristina, Spain)	21 % (w/v) salts	SRR988245	[101]
SS13	Saltern pond (Santa Pola, Alicante, Spain)	13 % (w/v) salts	SRR944625	[102]
SS19	Saltern pond (Santa Pola, Alicante, Spain)	19 % (w/v) salts	SRR328982	[103]
SS33	Saltern pond (Santa Pola, Alicante, Spain)	33 % (w/v) salts	SRR979792	[102]
SS37	Saltern pond (Santa Pola, Alicante, Spain)	37 % (w/v) salts	SRR328983	[103]
Xinjiang	Salt crust (Xinjiang, China)	> 30 % (w/v) salts	SRR18572989	[106]
Arctic Spring	Hypersaline arctic spring sediments	271.6 (g l ⁻¹) total dissolved solids	SRR13628066	[107]

Table S2. Identity percentages of the six new strains between themselves and best hits obtained against the high quality 16S rRNA gene sequence EzBioCloud database. Results above 98.7 % indicate that strains could belong to the same species, while results under this threshold mean they belong to different species. The percentages of identity are below the cutoff for the closest related species (*Pseudidiomarina homiensis* PO-M2^T) but above it among the new isolates.

Table S5. Differential biochemical features of the six isolates and representative members of the genus *Pseudidiomarina*

1, strain 1APP75-27a^T; 2, strain 1APP75-32.1; 3, strain 1ASP75-5; 4, strain 1ASP75-14; 5, strain 1APR75-15; 6, strain 1APR75-33.1; 7, *Pseudidiomarina atlantica* KCTC 42141^T; 8, *P. andamanensis* JCM 31645^T; 9, *P. halophila* KACC 17610^T; 10, *P. homiensis* DSM 17923^T; 11, *P. insulisalsea* LMG 23123^T; 12, *P. piscicola* CECT 9734^T; 13, *P. plaktonica* JCM 19263^T; 14, *P. salinarum* DSM 21900^T; 15, *P. taiwanensis* DSM 19709^T.

All the studied organisms show negative results for hydrolysis of starch, Simmons' citrate, Voges-Proskauer test, phenylalanine deaminase, production of indole, and positive results for catalase, oxidase, and nitrate reduction. None of the strains produces acid from D-arabinose, D-fructose, D-galactose, glycerol, D-glucose, lactose, maltose, mannitol, sucrose, D-trehalose, and D-xylose. Citrate, glutamate, and valerate cannot be used as sole carbon and energy sources by any of the strains.

+, positive; -, negative; NA, data not available; ND, growth not detected; w, weakly positive
