1.1.α-. Diversity of Bacteria and Archaea

(A) Bacteria

(B) Archaea

Figure 1. Sobs, Shannon and Coverage curves of bacteria (A) and archaea (B).

The rarefaction curve of Sobs, Shannon and Coverage diversity indexes gradually became smooth with the increase of sequencing depth (Figure S1). The sequencing depth is 30,000. At such depth, the Sobs, Shannon and Coverage diversity indexes for the observed OTUs was stable, indicating that the sequencing data volume was large enough to reflect microbial diversity information in the samples.

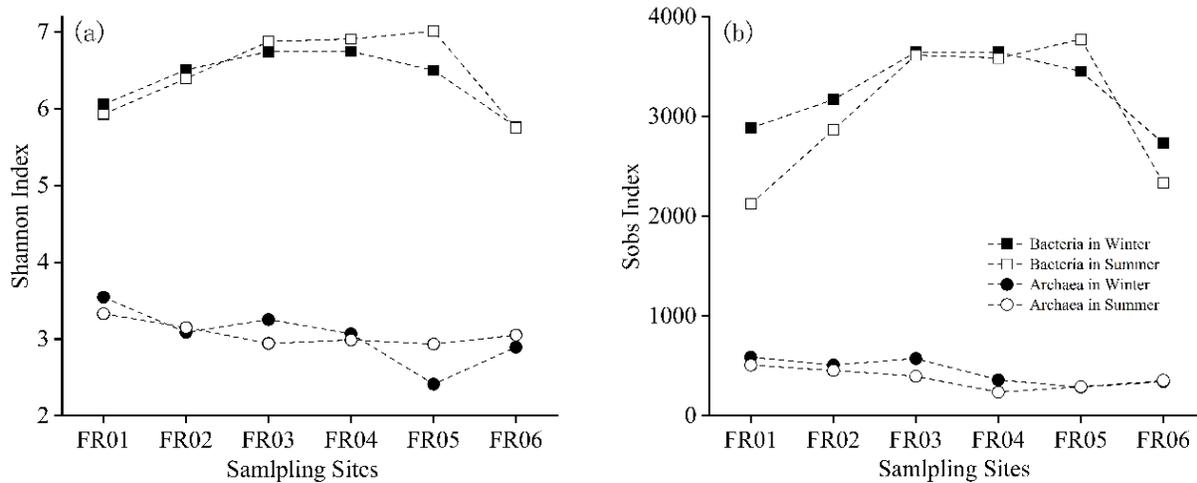

Figure 2. Shannon (a) and Sobs (b) index line graphs for bacteria and archaea.

The number of bacteria showed a pattern of rising and then falling by water transfer, while the number of archaea has been slowly declining. The number of bacterial OTUs fluctuate more in the summer, while that of archaea fluctuate more in the winter.
