	T-AOC (U/mgprot)	y=0.136-0.00045(425-x)	0.9868	425.00
	CAT (U/mgprot)	y=0.718-0.00004(466.7-x)	0.9833	466.70

R<sup>2</sup> represents the fitting degree of broken-line regression. The closer R<sup>2</sup> is to 1, the better the fitting degree. Therefore, we selected the indicators closer to 1 (R<sup>2</sup> > 0.95) to obtain the break point. Some indicated of R<sup>2</sup> < 0.95 had been deleted in Table S1. The optimal supplementation of Cr-yeast in liver health, immunity ability and antioxidant capacity were at the range of 800.00 - 1531.60, 319.30 - 961.00, and 425.00 - 665.00 µg Cr/kg respectively.

<sup>1</sup> Values are expressed as means of six replicates per treatment.

<sup>2</sup> LSD, low stocking density; HSD, high stocking density; TNF-α, Tumor necrosis factor-α; IL-1β, Interleukin-1β; IL-10, Interleukin-10; T3, thyroxine; T4, thyrotropine; SEM, standard error of means.

<sup>3</sup> Results of linear and quadratic analysis of five high stocking density groups.

\* Means t-test results of independent samples in group LSD and group HSD ( $p^* < 0.05$ ,  $p^{**} < 0.01$ ).

<sup>a-d</sup> Means in the same row without the same superscripts differ significantly ( $p < 0.05$ ).
