

Examination on the determinants in the dental occlusion

▪ Student number ()

▪ Name ()

▪ Expected score (/ 100)

1. When the steepness of articular eminence is small, the risk of occlusal interference in the posterior teeth is

① high ② low

2. In the case that the Bennett angle is high, to minimize the risk of occlusal interference, how should the cusp angle of posterior teeth be formed?

① get increased ② get decreased

3. In the case that the Bennett angle is high, to minimize the risk of occlusal interference, how should the sulcus and fossa of posterior teeth be formed?

① narrowly ② widely

4. When the horizontal overlap of incisal guidance is high, the risk of occlusal interference in the posterior teeth is

① high ② low

5. When the anterior guidance is steep, the risk of tooth wear in the anterior teeth is

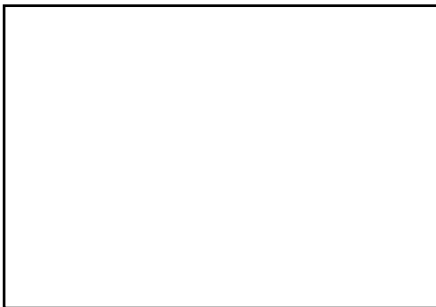

① high ② low

6. In the Angle Cl II occlusion, when the canine is worn excessively, the possibility of group function in the eccentric movements is

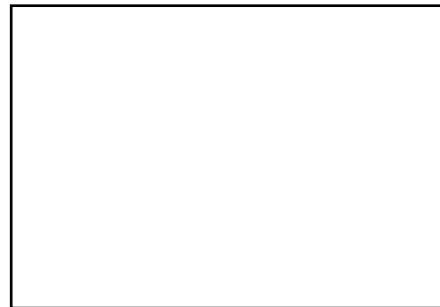

① high ② low

▪ Draw the path of functional and marginal movements of mandible.

7. In the frontal plane.

8. In the sagittal plane.

9. In the horizontal plane.
