Table S2. Measurements were carried out at C1s, S2p, N1s, O1s and Ag3d core levels; all data analysis results (Binding Energy – BE -, Full Width Half Maximum – FWHM – Atomic Ratio values and proposed assignments); the statistical incertitude in semiquantitative evaluation by XPS is estimated as 5% of the calculated value [1]

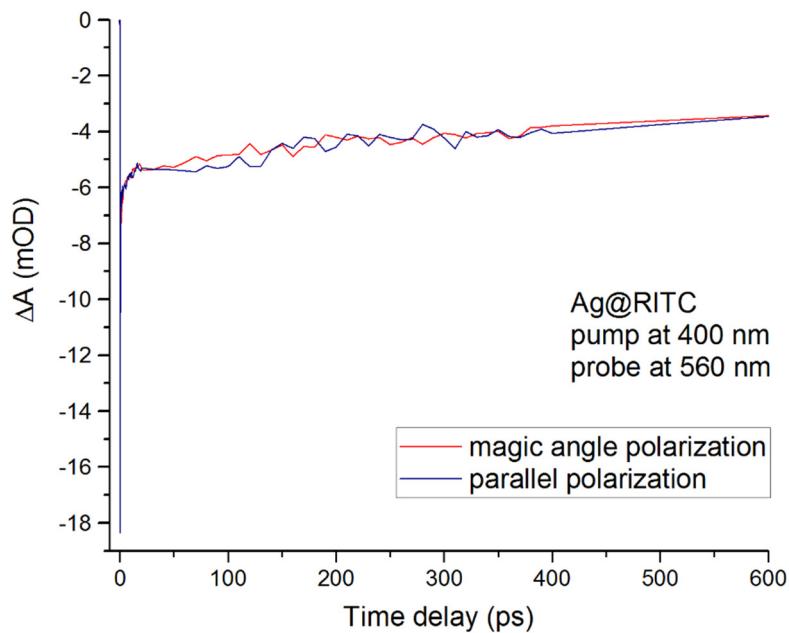

Figure S1. Dynamics of the fluorescence of the RITC dye molecules in the AgNPs – RITC sample when excited at 400 nm (on the LSPR of the AgNPs). The lack of difference between the parallel (blue line) and magic angle (red line) polarizations of the pump probe signals is indicative of hindered rotation of the dye molecule.
