

Supplemental Figure 1. Water pH in soil at initial state (green), at harvest of sorghum biomass (blue) and of sorghum Trudan Headless (orange) (the box plots indicate the median and the 25 and 75 percentiles; red diamond = mean, the dotted line separates the initial state and the 2 cultivars of sorghum). Significant differences between conditions are indicated by different letters at the level of $\alpha = 0.05$.

Supplementary Table 1. Average Dry Weight by plant of the 2 sorghum cultivars sampled at harvest for the 3 areas (10 samples by area, mean + SD).

	Area	Average Dry Weight per plant (g)
Trudan Headless	1	16 ± 9
	2	43 ± 16
	3	16 ± 8
Biomass 133	1	125 ± 88
	2	247 ± 98
	3	16 ± 15

Supplementary Table 2. Percent of mobile TE (As, Cd, Cr, Cu, Ni, Pb, Zn) calculated as extractable concentrations over total concentrations in soil for the plots for the 2 sorghum cultivars at the 3 areas (mean \pm SD). Significant differences between conditions are indicated by different letters at the level of $\alpha = 0.05$.
