10 µL/band 2 µL/band

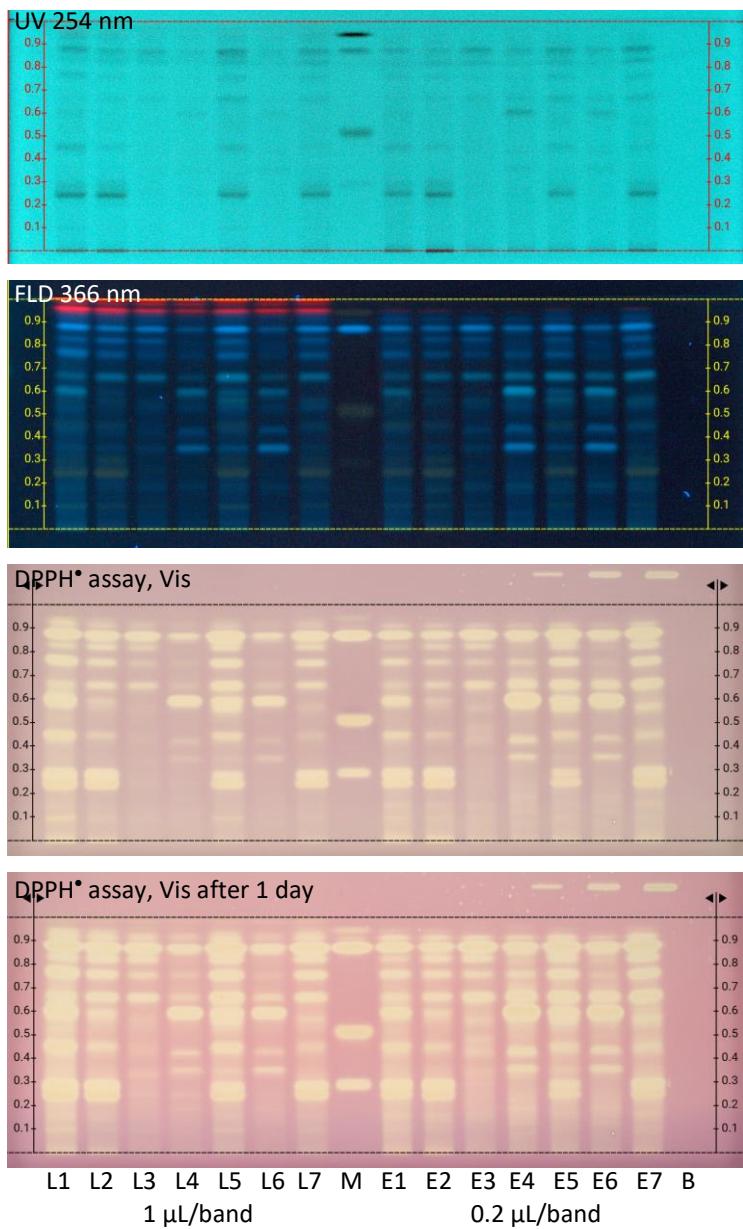

**Figure S3** HPTLC plate selection: HPTLC–Vis/UV/FLD chromatograms showing the comparison of the same separation but on two different plates, *i.e.* HPTLC plate silica gel 60 with fluorescence indicator F<sub>254</sub> *versus* acid-stable F<sub>254s</sub>: 14 peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1 mg/mL each; 10 µL/band for L1–L7 and 2 µL/band for E1–E7) along with respective solvent blank (B) separated with 7 mL ethyl acetate – toluene – formic acid – water 8:2:1.5:1 and detected at white light illumination, UV 254 nm and FLD 366 nm, followed by the Gram-negative *Aliivibrio fischeri* bioassay (bacterial luminescence depicted as greyscale image), derivatization via the natural product A reagent and then anisaldehyde sulfuric acid reagent (all detections on the same plate)

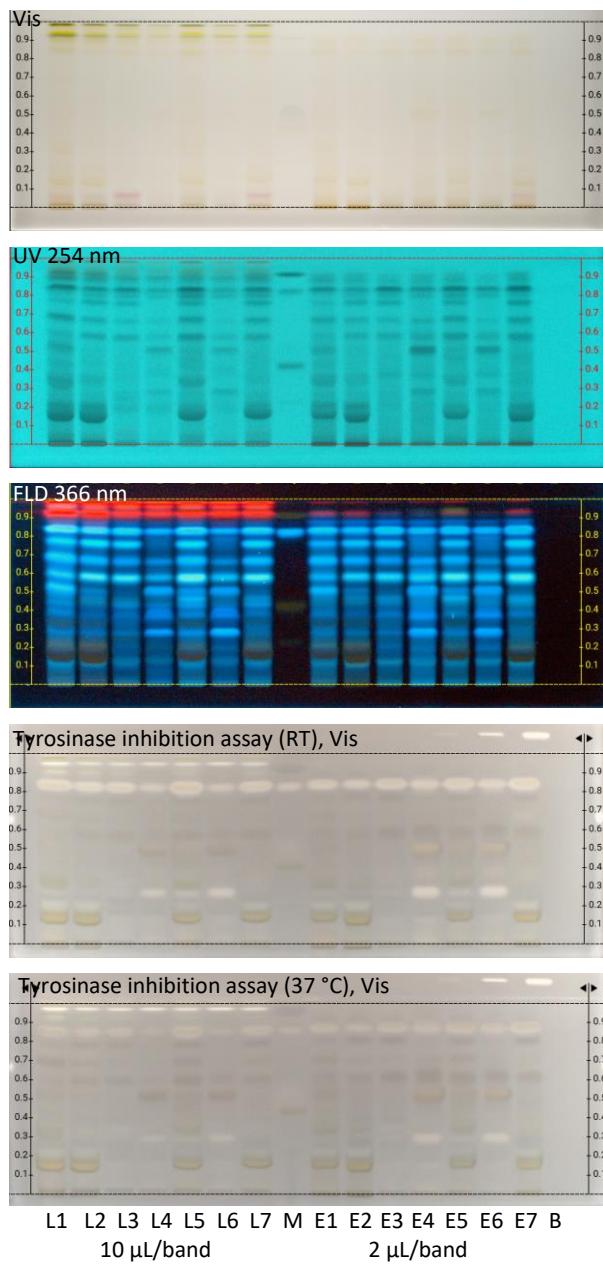

**Figure S3** continued

**Figure S4** Standard mixture assignment: HPTLC-Vis/UV/FLD chromatograms of the individual reference compounds (1 µg/band each of apigenin **A**, luteolin-7-O-glucoside **L**, eriocitrin **E**, and rosmarinic acid **R**) and the oversprayed standard mixture (**M**), chromatographic system as in Figure. S3. After 2 days, eriocitrin was comparatively better detectable as rusty zone.

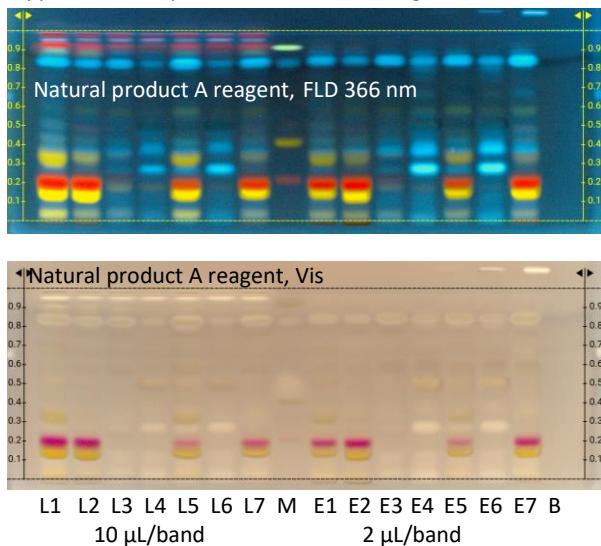

**Figure S5** HPTLC-DPPH<sup>•</sup> assay: HPTLC-Vis/UV/FLD chromatograms of 14 peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1mg/mL each; 1  $\mu$ L/band for L1–L7 and 0.2  $\mu$ L/band for E1–E7) on HPTLC plate silica gel 60 F<sub>254s</sub> along with standard mixture (M; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 0.5  $\mu$ g/band each) and the respective solvent blank (B) separated with 7 mL ethyl acetate – toluene – formic acid – water 8:2:1.5:1 and detected at white light illumination, UV 254 nm and FLD 366 nm as well as after the DPPH<sup>•</sup> assay, detected at white light illumination. The DPPH<sup>•</sup> response was more intense after one day. The PC gallic acid was applied at 0.5, 1.3 and 2  $\mu$ L/band (0.1 mg/mL in methanol) in the upper right plate.

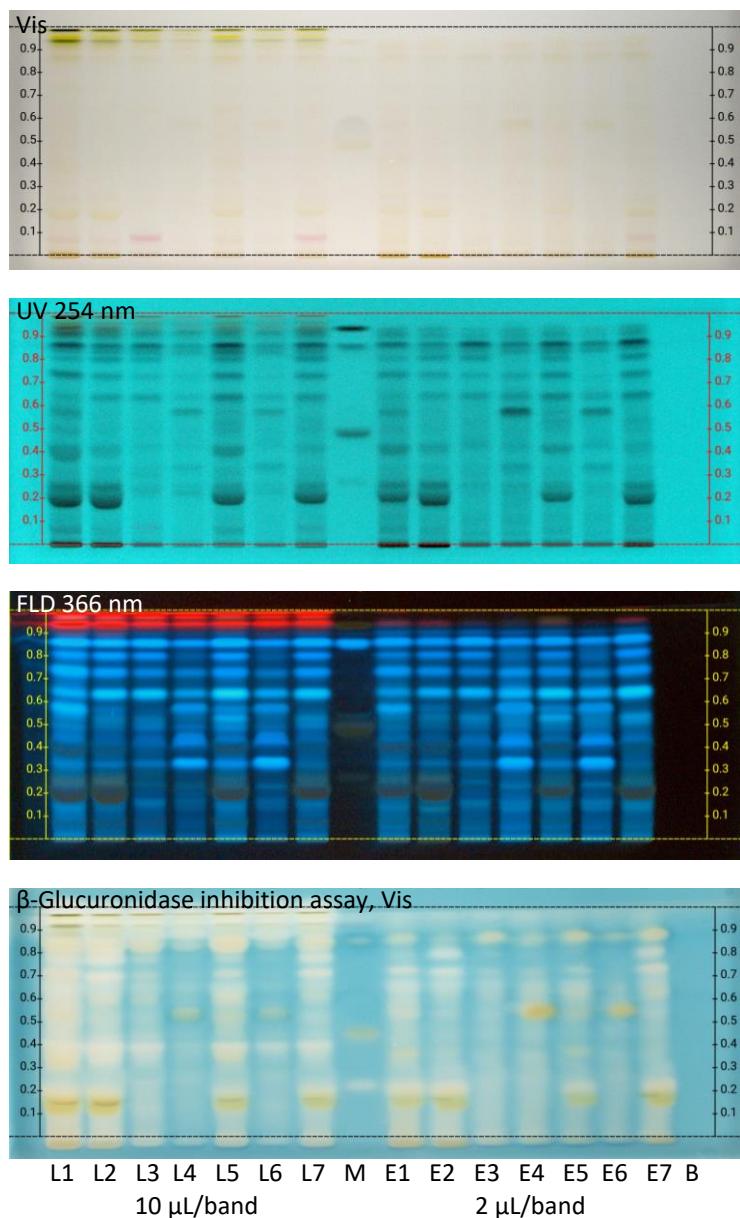

**Figure S6** HPTLC-tyrosinase inhibition assay: HPTLC-Vis/UV/FLD chromatograms of 14 peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1 mg/mL each; 10 µL/band for L1–L7 and 2 µL/band for E1–E7) on HPTLC plate silica gel 60 F<sub>254s</sub> along with standard mixture (M; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 1 µg/band each) and the respective solvent blank (B) separated with 7 mL ethyl acetate – toluene – formic acid – water 8:2:1.5:1 and detected at white light illumination, UV 254 nm and FLD 366 nm as well as after the tyrosinase inhibition assay comparing incubation at room temperature *versus* 37 °C, detected at white light illumination. The PC kojic acid was applied at 1, 3 and 6 µL/band (0.1 mg/mL in ethanol) in the upper right plate. After 5 days, the assay plate was derivatized via the natural product A reagent detected at FLD 366 nm and white light illumination.

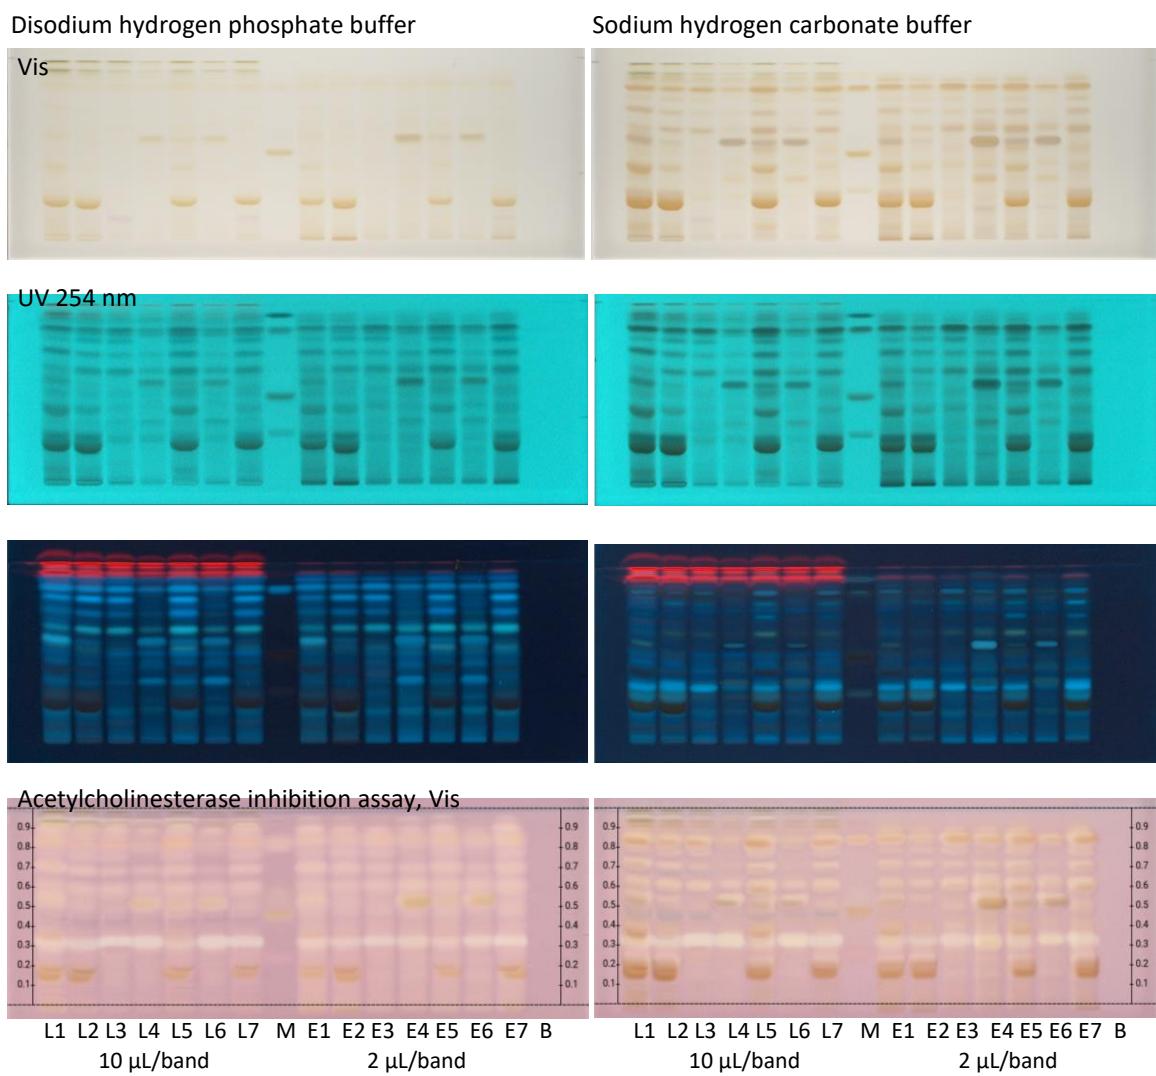

Applied on the tyrosinase inhibition autogram after 5 d

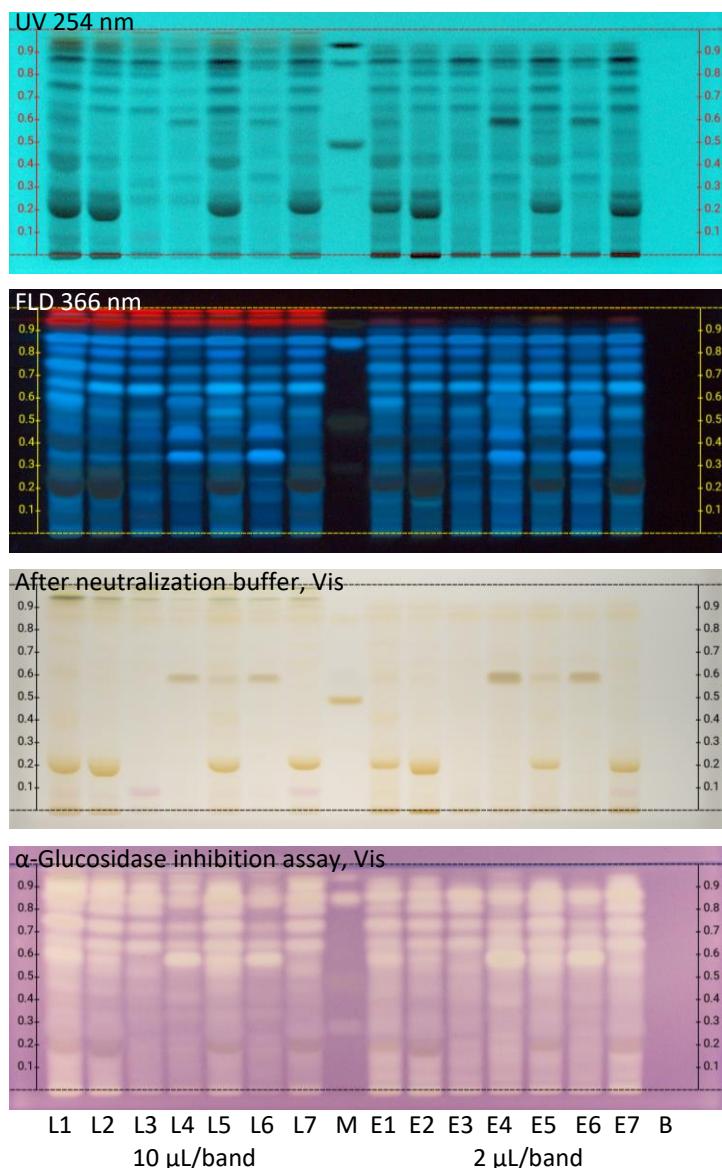

**Figure S6** continued

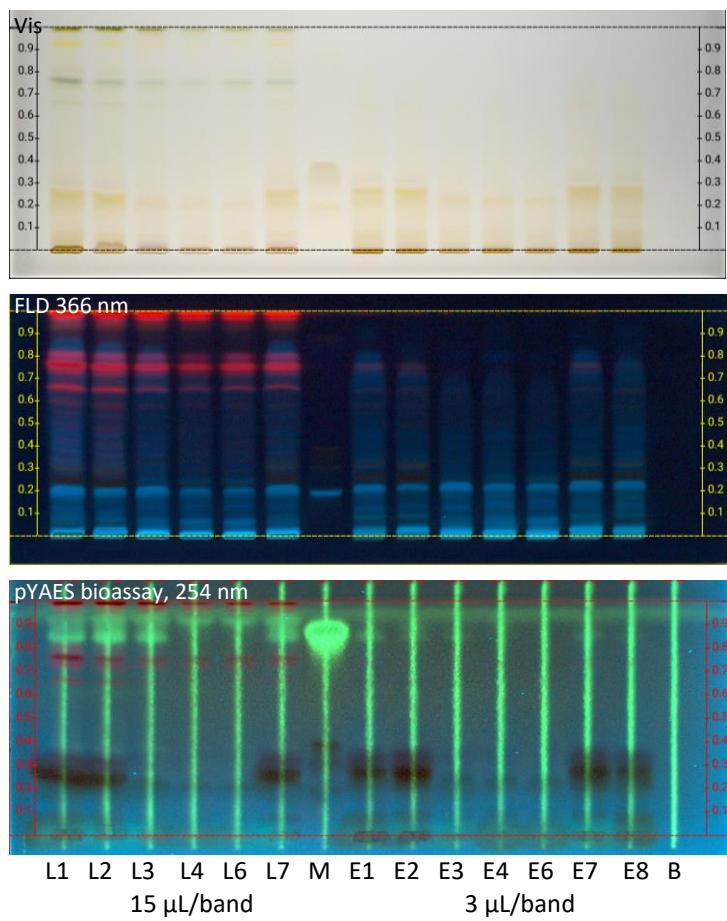

**Figure S7** HPTLC- $\beta$ -glucuronidase inhibition assay: HPTLC-Vis/UV/FLD chromatograms of 14 pepper-mint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1mg/mL each; 10  $\mu\text{L}/\text{band}$  for L1–L7 and 2  $\mu\text{L}/\text{band}$  for E1–E7) on HPTLC plate silica gel 60 F<sub>254s</sub> along with standard mixture (M; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 1.5  $\mu\text{g}/\text{band}$  each) and the respective solvent blank (B) separated with 7 mL ethyl acetate – toluene – formic acid – water 8:2:1.5:1 and detected at white light illumination, UV 254 nm and FLD 366 nm as well as after the  $\beta$ -glucuronidase inhibition assay, detected at white light illumination

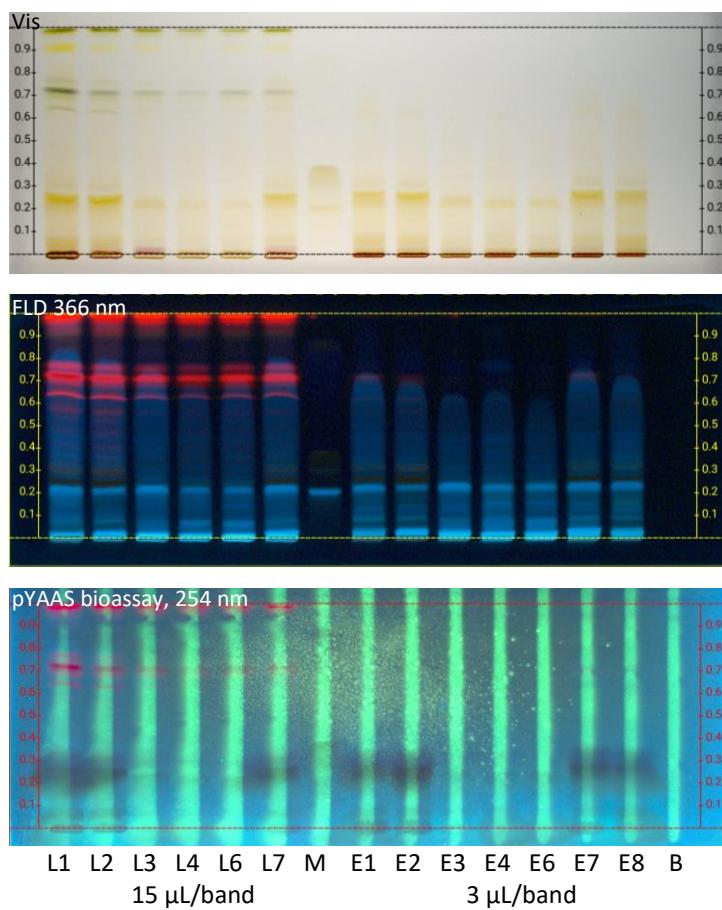

**Figure S8** HPTLC-acetylcholinesterase inhibition assay performed using two different buffers, *i.e.* disodium hydrogen phosphate buffer (8 g in 60 mL water, citric acid 0.1 M added to reach pH 7.5, filled up to 100 mL) *versus* sodium hydrogen carbonate buffer (2.5 g in 100 mL water): HPTLC-Vis/UV/FLD chromatograms of 14 peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1 mg/mL each; 10  $\mu$ L/band for L1–L7 and 2  $\mu$ L/band for E1–E7) on HPTLC plate silica gel 60 F<sub>254s</sub> along with standard mixture (**M**; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 1.5  $\mu$ g/band each) and the respective solvent blank (**B**) separated with 7 mL ethyl acetate – toluene – formic acid – water 8:2:1.5:1 and detected at white light illumination, UV 254 nm and FLD 366 nm as well as after the acetylcholinesterase inhibition assay, detected at white light illumination. The PC rivastigmine was applied at 2, 4 and 8  $\mu$ L/band (0.1 mg/mL in methanol) in the upper right plate.

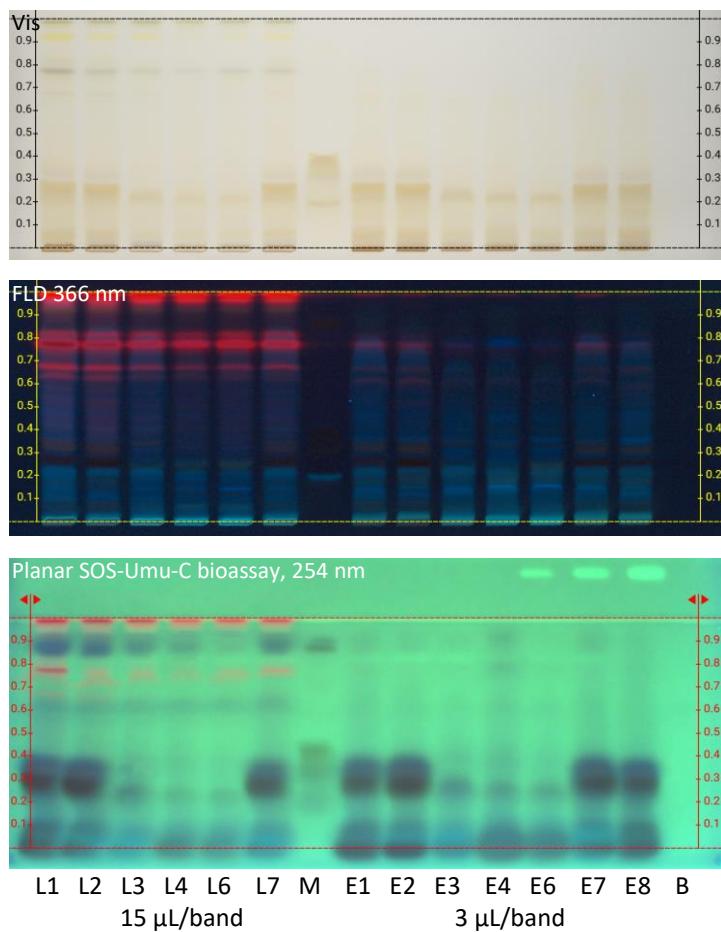

**Figure S9** HPTLC- $\alpha$ -glucosidase inhibition assay: HPTLC-Vis/UV/FLD chromatograms of 14 peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1 mg/mL each; 10  $\mu$ L/band for L1–L7 and 2  $\mu$ L/band for E1–E7) on HPTLC plate silica gel 60 F<sub>254s</sub> along with standard mixture (**M**; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 1.5  $\mu$ g/band each) and the respective solvent blank (**B**) separated with 7 mL ethyl acetate – toluene – formic acid – water 8:2:1.5:1 and detected at white light illumination, UV 254 nm and FLD 366 nm as well as after the  $\alpha$ -glucosidase inhibition assay, detected at white light illumination.

**Figure S10** Planar bioprofiling for estrogenic and anti-estrogenic compounds: HPTLC-Vis/UV/FLD chromatograms of peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1 mg/mL each; 15 µL/band or 1.5 mg for L1–L7, L5 skipped, and 3 µL/band or 0.3 mg for E1–E8; E8 instead of E5) on HPTLC plate silica gel 60 along with standard mixture (**M**; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 2.3 µg/band each) and the respective solvent blank (**B**) separated with 7 mL ethyl acetate – toluene – methanol – water 4:1:1:0.4 and detected at white light illumination and FLD 366 nm as well as after the multiplex pYAES bioassay at 254 nm. There were revealed as green fluorescent band up to two apolar estrogens in the sample and one estrogen (rosmarinic acid) in the standard mixture. Some anti-estrogenic effects were observed as signal reduction of the green fluorescent 17 $\beta$ -estradiol stripe. The green fluorescence of the 17 $\beta$ -estradiol stripe was considered as positive control.

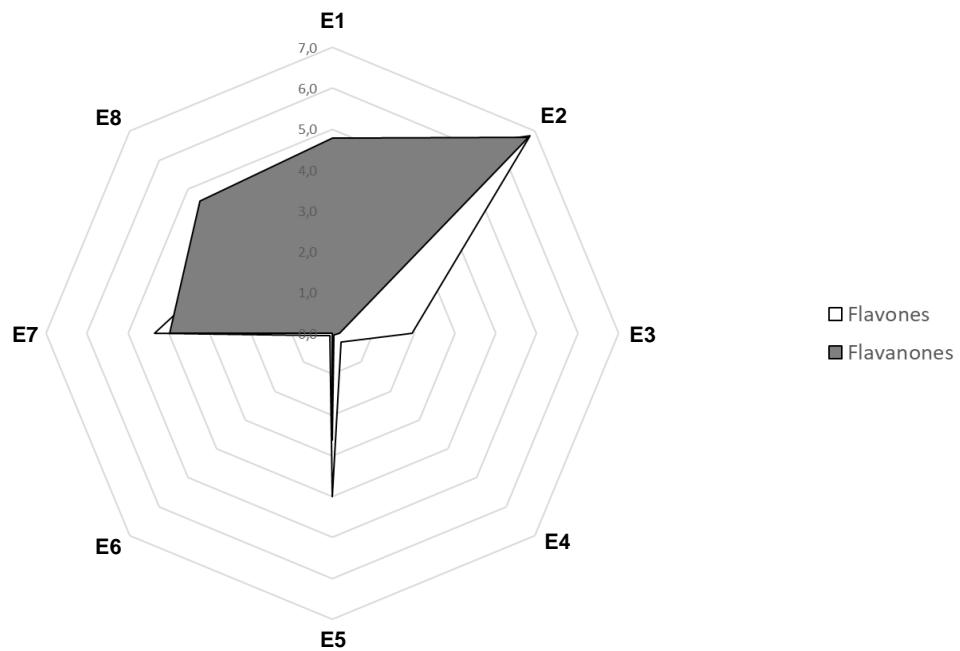

**Figure S11** Planar bioprofiling for androgenic and antiandrogenic compounds: HPTLC–Vis/UV/FLD chromatograms of peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1 mg/mL each; 15 µL/band or 1.5 mg for L1–L7, L5 skipped, and 3 µL/band or 0.3 mg for E1–E8; E8 instead of E5) on HPTLC plate silica gel 60 along with standard mixture (M; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 2.3 µg/band each) and the respective solvent blank (B) separated with 7 mL ethyl acetate – toluene – methanol – water 4:1:1:0.4 and detected at white light illumination and FLD 366 nm as well as after the multiplex pYAAS bioassay at 254 nm. There were no androgens detected as green fluorescent band despite the high sample load but anti-androgenic effects as signal reduction of the green fluorescent testosterone stripe. The green fluorescence of the testosterone stripe was considered as positive control.

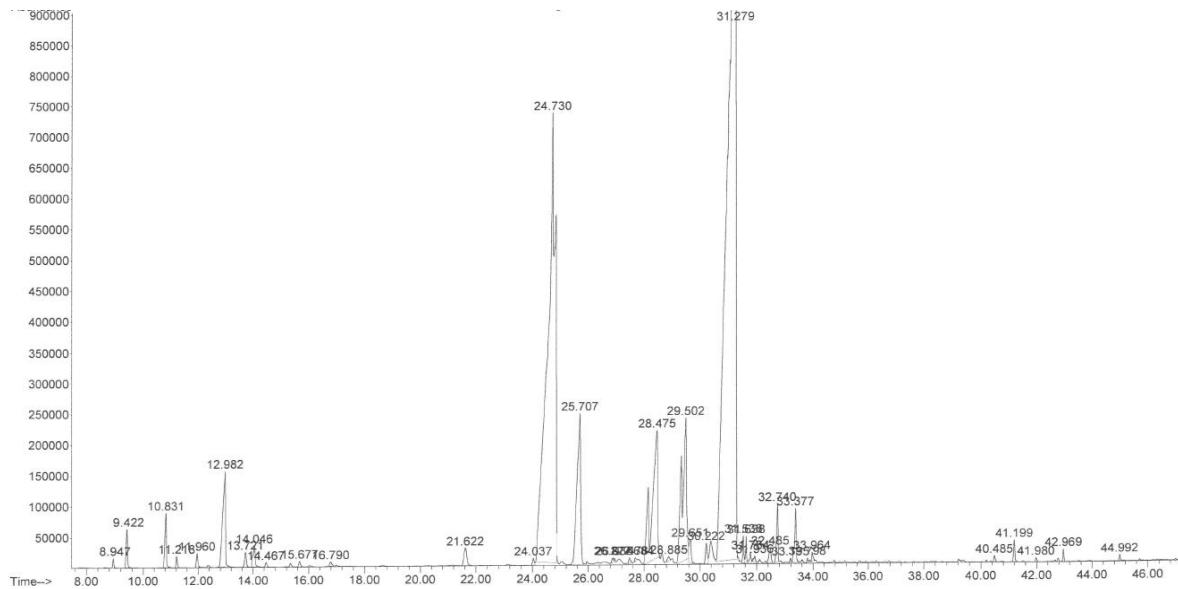

**Figure S12** Planar bioprofiling for genotoxic compounds: HPTLC-Vis/UV/FLD chromatograms of peppermint products (Table 1) extracted with ethanol – ethyl acetate – water 1:1:1 (0.1 mg/mL each; 15  $\mu$ L/band or 1.5 mg for L1–L7, L5 skipped, and 3  $\mu$ L/band or 0.3 mg for E1–E8; E8 instead of E5) on HPTLC plate silica gel 60 along with standard mixture (M; eriocitrin, luteolin-7-O-glucoside, rosmarinic acid, and apigenin, 2.3  $\mu$ g/band each) and the respective solvent blank (B) separated with 7 mL ethyl acetate – toluene – methanol – water 4:1:1:0.4 and detected at white light illumination and FLD 366 nm as well as after the planar SOS-Umu-C bioassay at 254 nm. The PC 4-nitroquinoline 1-oxide was applied at 0.4, 1 and 2  $\mu$ L/band (500 pg/ $\mu$ L in methanol) in the upper right plate. There was no green fluorescent genotoxin band revealed in the samples despite the high sample load.

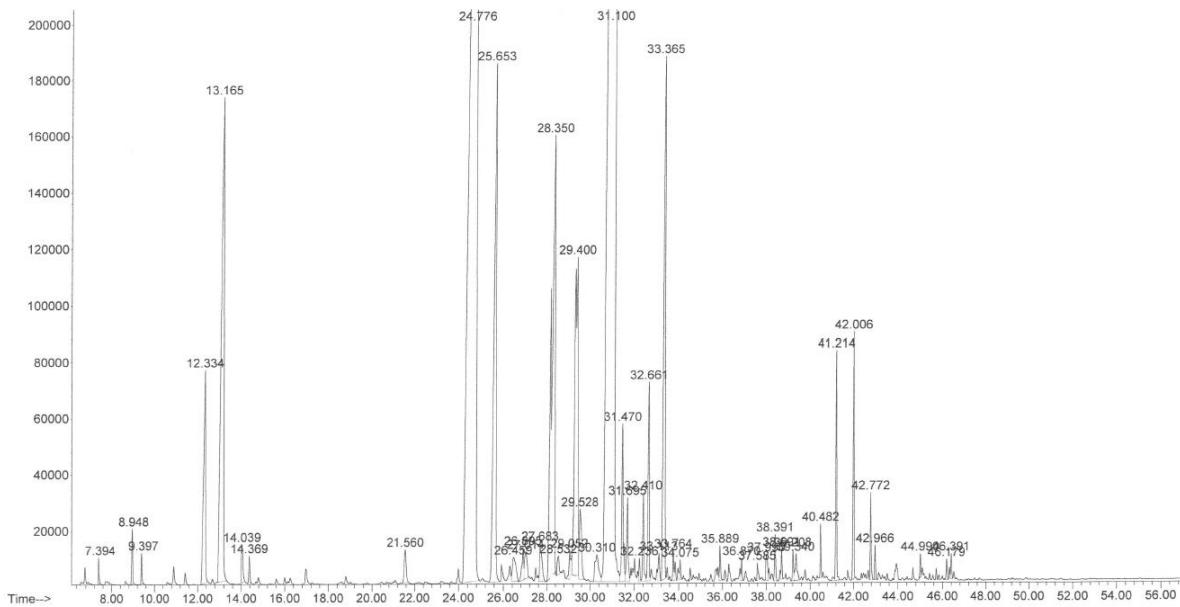

**Figure S13.** HPLC-PDA spider-web diagram of total content (%, dry basis) of flavones (luteolin-7-*O*-glucuronide, luteolin-7-*O*-rutinoside and isorhoifolin) and flavanones (eriocitrin and eriodictyol-7-*O*-glucoside) of different peppermint leaf samples L1–L8 from USA and Europe (Table 1)

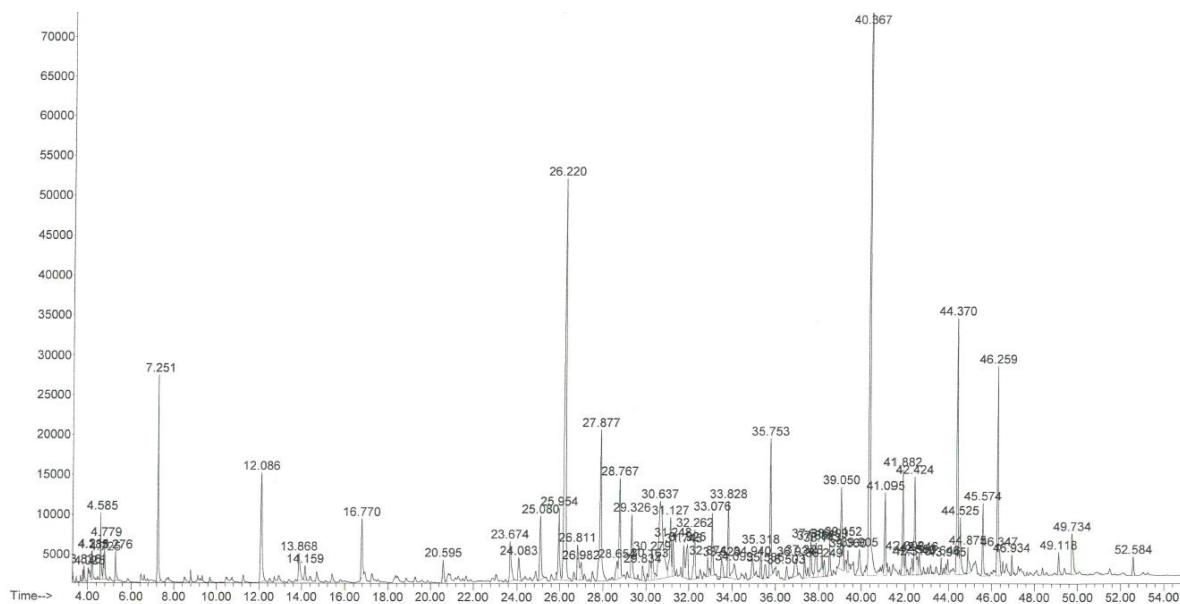

**Figure S14.** HPLC-PDA spider-web diagram of total content (% dry basis) of flavones (luteolin-7-O-glucuronide, luteolin-7-O-rutinoside and isorhoifolin) and flavanones (eriocitrin and eriodictyol-7-O-glucoside) of different peppermint leaf samples E1-E8 from USA and Europe (Table 1)

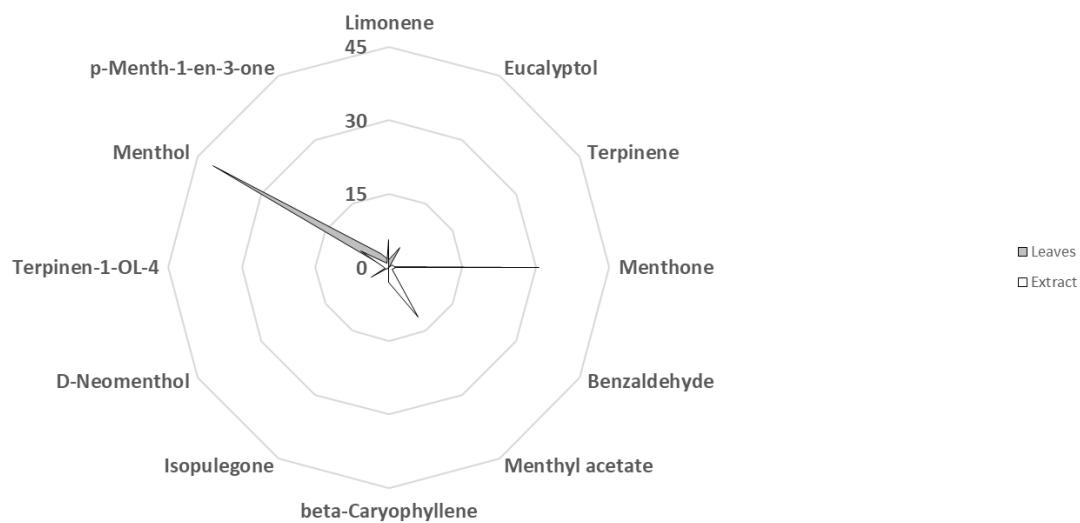

**Figure S15.** Headspace SPME-GC-FID profile of the proprietary peppermint leaf sample **L5** from USA, showing terpinolene (11.22 min, 15.68 min), limonene (11.96 min), eucalyptol (12.98 min), terpinene (14.05 min), menthone (24.73 min, 25.71 min), methyl acetate (26.88 min, 28.48 min), benzaldehyde (26.94 min), linalool (27.68 min),  $\beta$ -caryophyllene (28.89 min), neomenthol (29.50 min), menthol (31.28 min, 31.64 min),  $\alpha$ -terpineol (32.485 min), and *p*-menth-1-en-3-one (33.38 min)

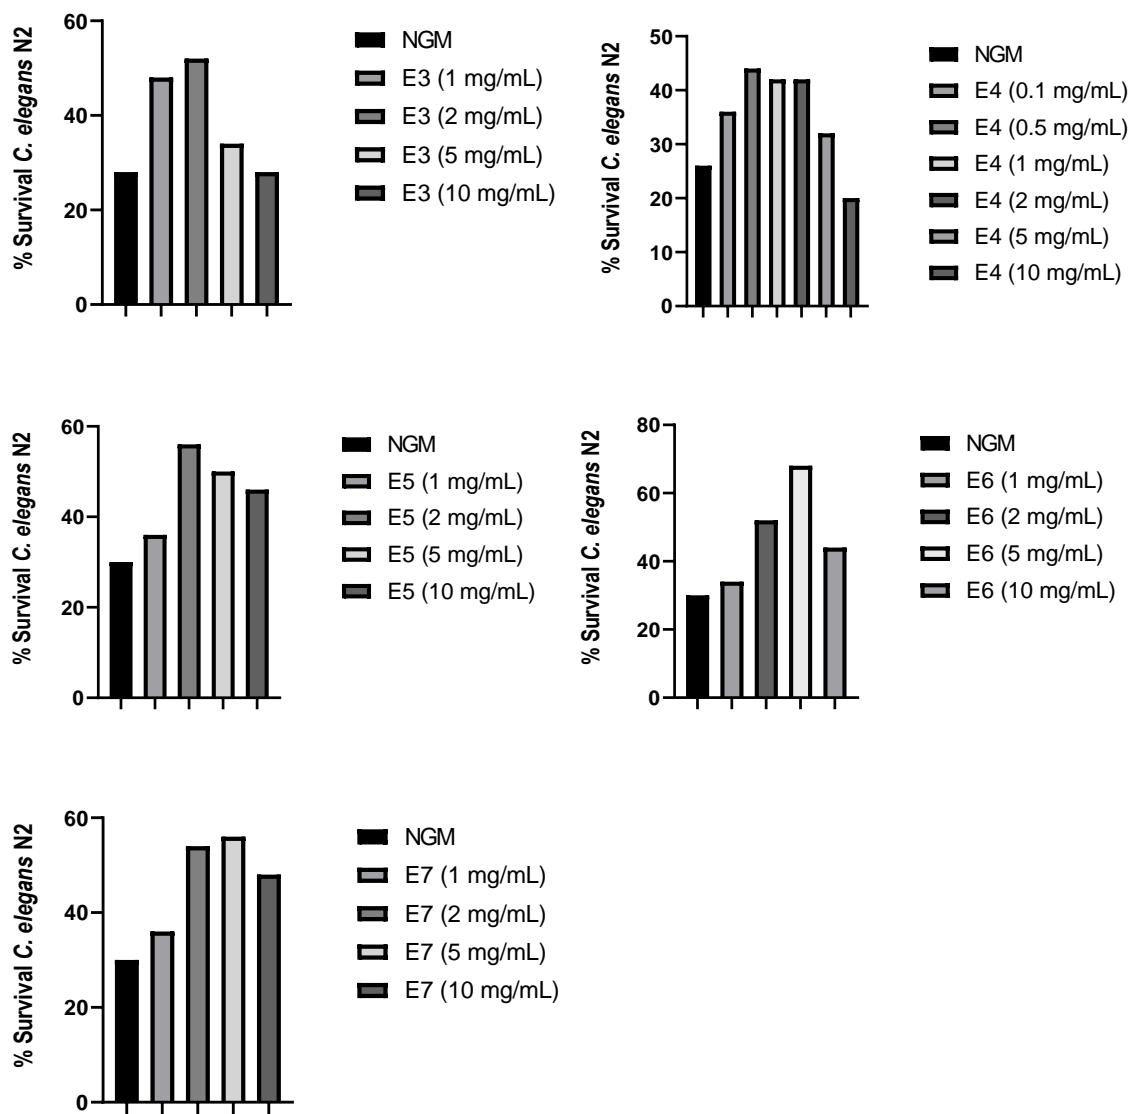

**Figure S16.** Headspace SPME-GC-FID profile of the European peppermint leaf sample **L2**, showing limonene (12.33 min), eucalyptol (13.17 min), terpinene (14.37 min), menthone (24.77 min, 25.65 min), methyl acetate (26.89 min, 28.35 min), isomenthyl acetate (27.01 min), linalool (27.68 min), isopulegol (28.53 min),  $\beta$ -caryophyllene (29.05 min), neomenthol (30.31), menthol (31.10 min, 31.64 min),  $\alpha$ -terpineol (32.41 min), *p*-menth-1-en-3-one (33.37 min), piperitone (37.99 min), and eugenol (42.77 min)

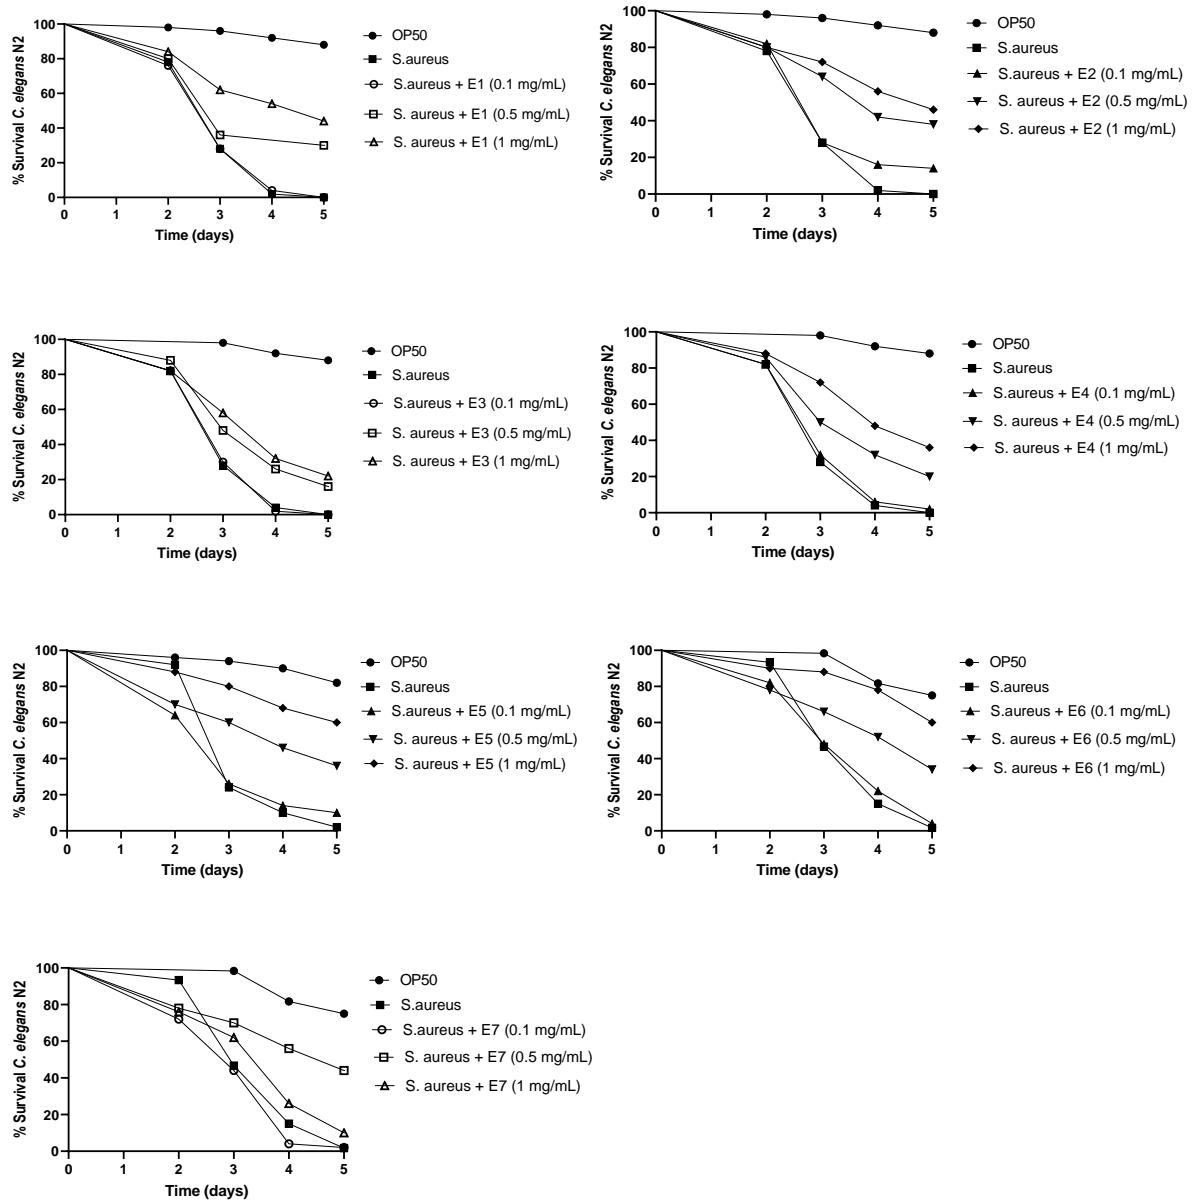

**Figure S17.** Headspace SPME–GC–FID profile of the European peppermint extract sample **E2**, showing limonene (12.09 min), hex-2-enal (13.87 min), terpinene (14.16 min), menthone (24.08 min), benzaldehyde (26.81 min), *p*-menth-4-en-3-one (26.98 min), menthol acetate (27.88 min, 28.48 min),  $\beta$ -caryophyllene (28.77 min), *p*-mentha-2,8-dien-1-ol (30.16 min), menthol (30.64 min), and *p*-menth-1-en-3-one (33.07 min)

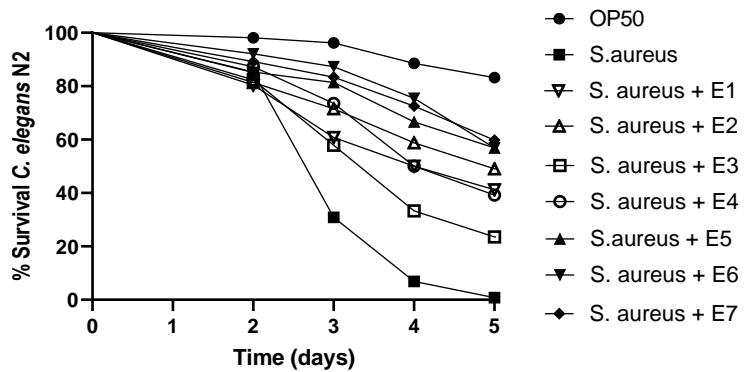

**Figure S18** Headspace SPME–GC–FID relative response proportion (%) of major volatile components found in the European peppermint leaf sample **L2** and the corresponding extract **E2**

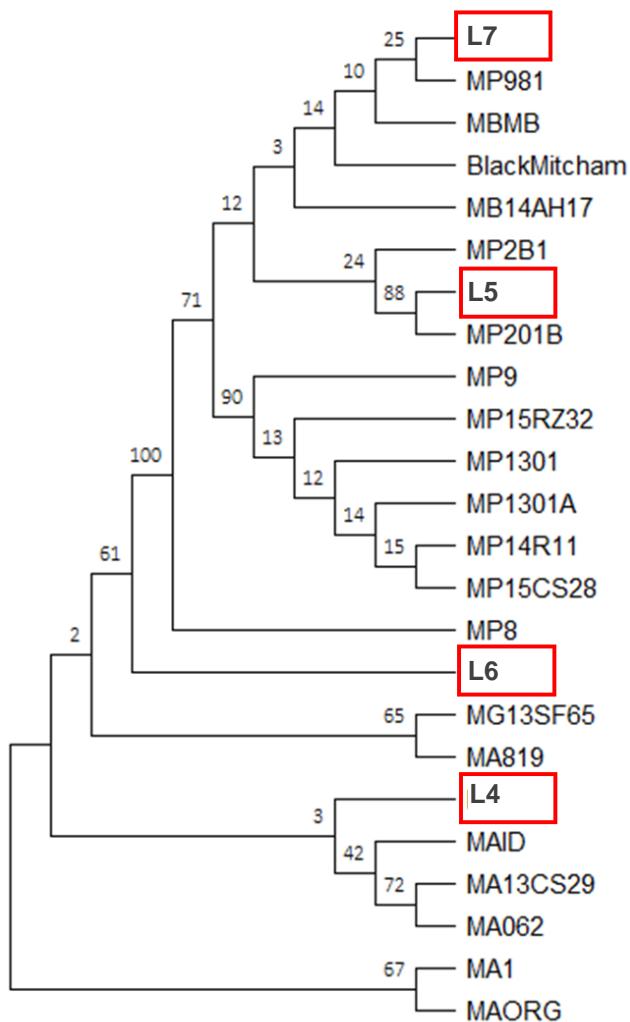

**Figure S19** Dose-response of the peppermint extract samples E1–E7 on the antioxidant activity in the *C. elegans* model. Worms were fed with peppermint extract samples at different doses, and after exposure to acute oxidative stress, the percentage of worm's survival was determined.

**Figure S20** Dose-response of the peppermint extract samples E1-E7 on the pathogen protection in the *C. elegans* model. Worms were fed with peppermint extract samples at different doses and infected with a lawn of *S. aureus* ATCC 25923. The percentage of alive worms determined every day is represented.

**Figure S21.** Percentage of survival of *C. elegans* N2 treated with the peppermint extract samples E1-E7 and infected with the pathogen *S. aureus* (ATCC 25923). p-Values < 0.0001 for all samples compared to control-infected condition. Log Rank T-test was applied. Data are the average of two independent assays.

**Figure S22.** Phylogenetic relationships of the 24 mint varieties inferred using the maximum parsimony. The percentage of replicate trees in which the associated varieties clustered together in the bootstrap test (500 replicates) were shown next to the branches.
