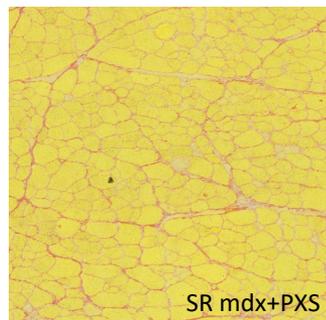

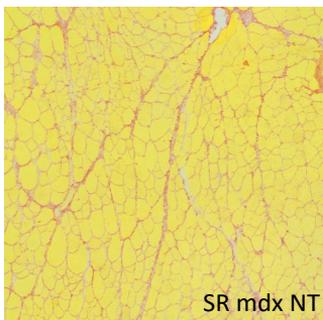

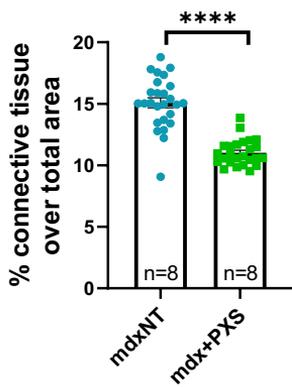

Figure S1: Treatment of 3-month-old mdx mice with PXS-5131 for one month is sufficient to reduce inflammation and fibrosis in Tibialis Anterior muscle.

A) and B) Charts to the left show the quantification of neutrophils (expressed as Ly6G-positive pixels over total area) and macrophages (expressed as F4/80-positive pixels over total area) from tibialis anterior sections of 4-month-old *mdx* mice. Each chart point represents the output of a single microscopy field; statistical analysis was performed via nested t-test, considering the single muscles as independent biological replicates. n indicates number of animals; ** p-value < 0.01, **** p-value < 0.0001. Immunofluorescence images show examples of the antibody staining as seen in magnified areas of fields acquired from a control (center) and a treated animal (right). Scale bars corresponds to 70 microns. **C)** Quantification and representative images of Sirius red staining on tibialis anterior sections of 4-month-old *mdx* mice. Each chart point represents the measurement obtained from a whole tissue section; statistical analysis was performed via nested t-test, considering the single muscles as independent biological replicates. n indicates number of animals; **** p-value < 0.0001. Brightfield images show magnified areas from a control (center) and a treated (right) animal. Scale bars corresponds to 140 microns.

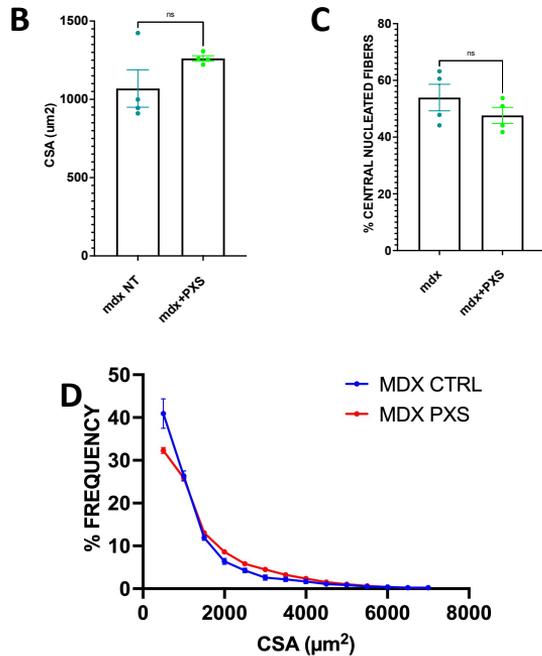

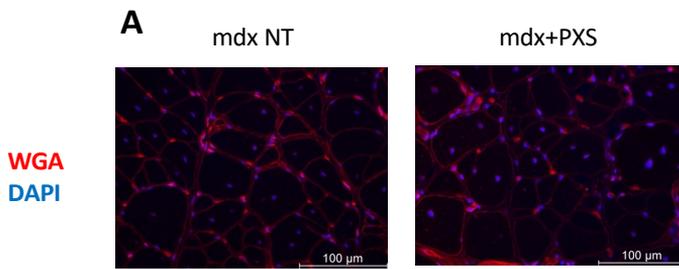

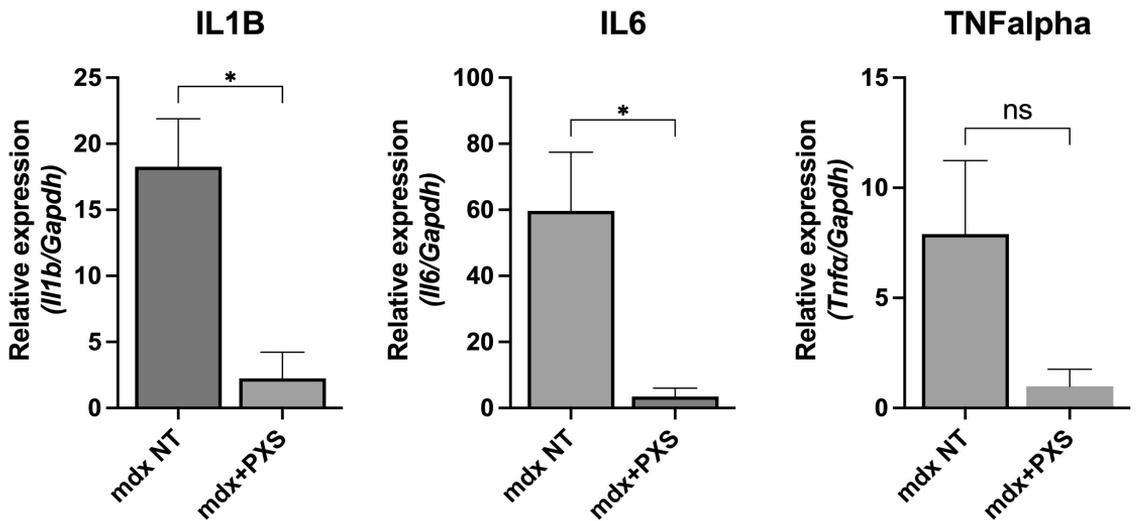

Figure S2: Treatment with PXS-5131 did not significantly alter muscle fibers morphology.

A) Representative gastrocnemius sections stained with DAPI (blue) and wheat germ agglutinin, WGA (red). **B)** Mean cross-sectional area (CSA) of gastrocnemius muscle fibers shows no differences between non-treated and PXS treated *mdx* mice (n=4 muscles per group; 4000-6000 fibers per muscle). **C)** Analysis of central nuclei shows no significant differences in the percentage of central nucleated fibers between the two groups of *mdx* mice (n=4 per group; 2000-2500 fibers). Data are shown as mean \pm SEM. Statistical analysis was performed using two-tailed Student's t-test. **D)** Chart shows the CSA distribution of all the fibers used to calculate the averages shown in panel B.

Primer sequences:

Il6: fwd-AGGATACCACTCCCAACAGAC rev-GCCATTGCACAACTCTTTTCTC

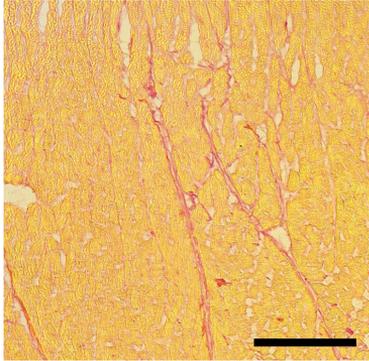

Il1β: fwd-GGACATGAGCACCTTCTTTTCC rev-TTGTTTCATCTCGGAGCCTGTAG

Tnf: fwd-GAAAAGCAAGCAGCCAACCA rev-CGGATCATGCTTTCTGTGCTC

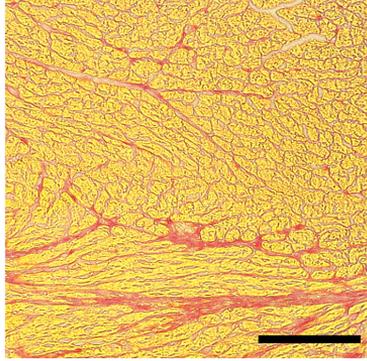

Figure S3: Treatment with PXS-5131 decreased the expression of inflammatory cytokines at the RNA level.

Real-time PCR were performed on the same samples used for *Spp1* quantification, following the same experimental procedure. Given the low levels of cytokine expression, however, some samples were excluded and numerosity was at least ≥ 3 .

6-month-old mdx

9-month-old mdx

12-month-old mdx

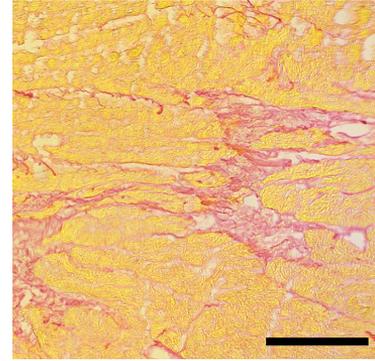

Figure S4: Representative images of fibrosis progression in the heart of *mdx* mice at different ages.

Heart cryosections from *mdx* mice were stained with Sirius Red; the age of the animals is reported on top of each panel. Scale bars corresponds to 140 microns.
