Contents:

1. Figure S1: **S1**
2. Figure S2: **S2**
3. Figure S3: **S3**
4. ¹H and ¹³C-NMR spectra of FAHFAs: **S4-S9**

Figure S1: Reporter gene (luciferase) assay results of oleic acid, linoleic acid esters of 12-HSA and 12-HOA and free fatty acids (EPA and 12-HSA)

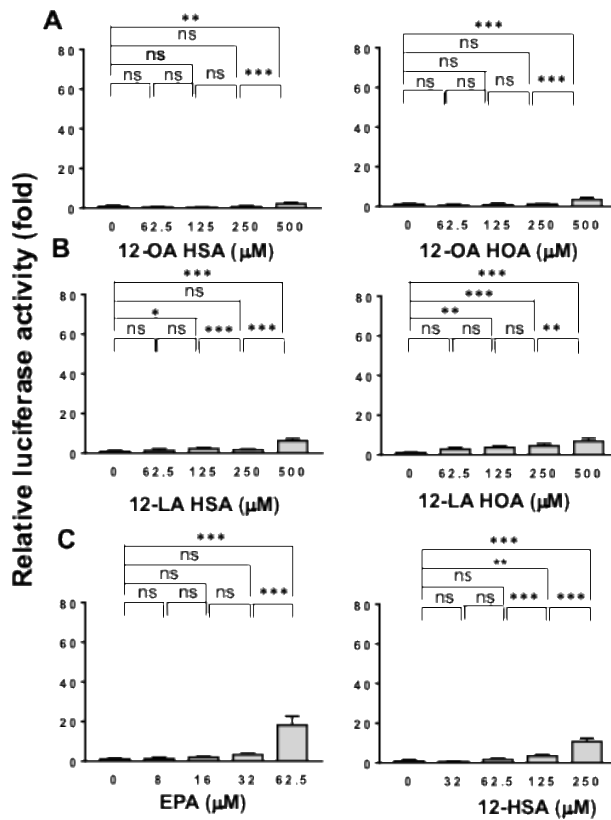

Figure S2: Relative expression of DDIT3 (CHOP) (NM001195053) in response to 12-EPAHSA treatment. ** $p < 0.01$, (one-way ANOVA) (n=6).

Figure S3: Relative intensity folds of oxidative stress induced by H₂O₂ and effect of 12-EPAHSA treatment. ***p<0.001, (one-way ANOVA) (n=6 for control and n=4 for H₂O₂). The cellular oxidative stress due to H₂O₂-induced ROS was measured by the dichlorofluorescein-diacetate (DCFH-DA) assay with the protocol established in our laboratory [17-18]. A condition of cellular stress in HepG2 cells is evoked by treating 0.25 mM H₂O₂ for 30 min, and fluorescence intensity was read at 485 (excitation) and 525 (emission) nm using Wallac 1420 ARVO Mx plate reader (PerkinElmer, Japan).

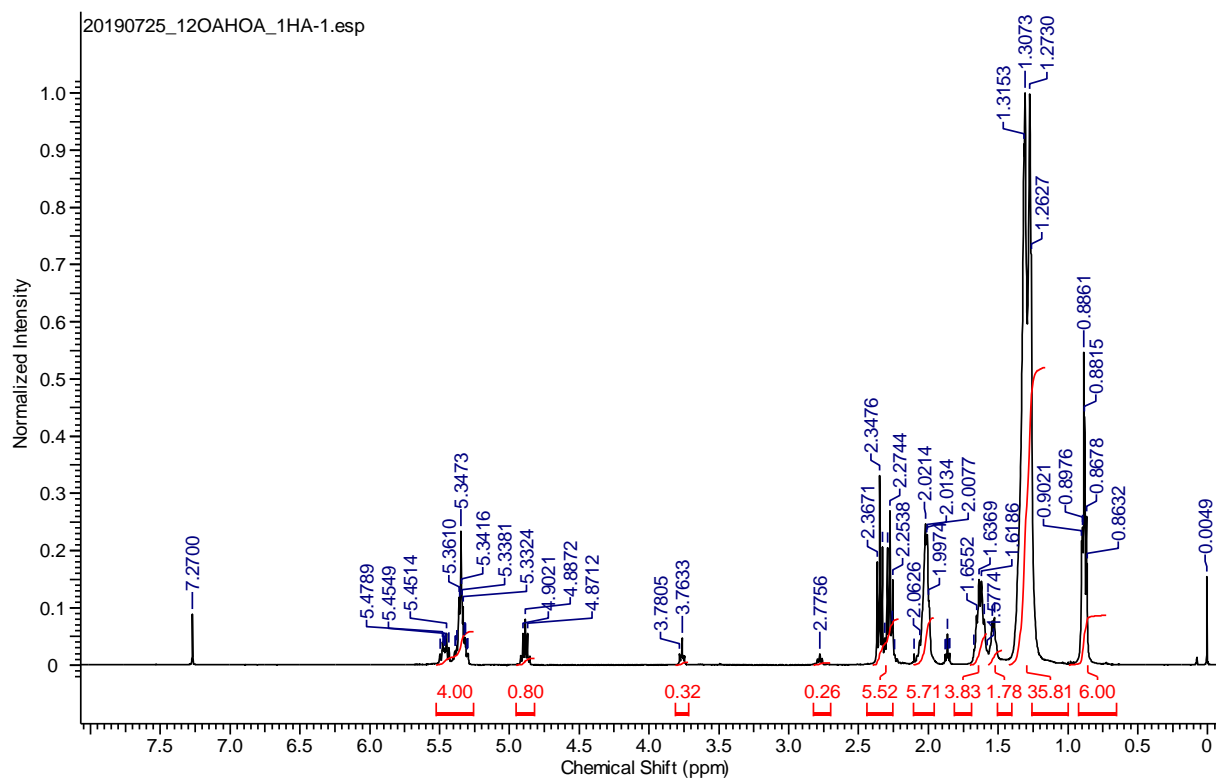

3. ^1H and ^{13}C -NMR spectra of FAHFAs

^1H and ^{13}C -NMR of 12-OAHSA (2)

^1H and ^{13}C -NMR of 12-OAHOA (2a)

^1H and ^{13}C -NMR of 12-LAHSA (3)

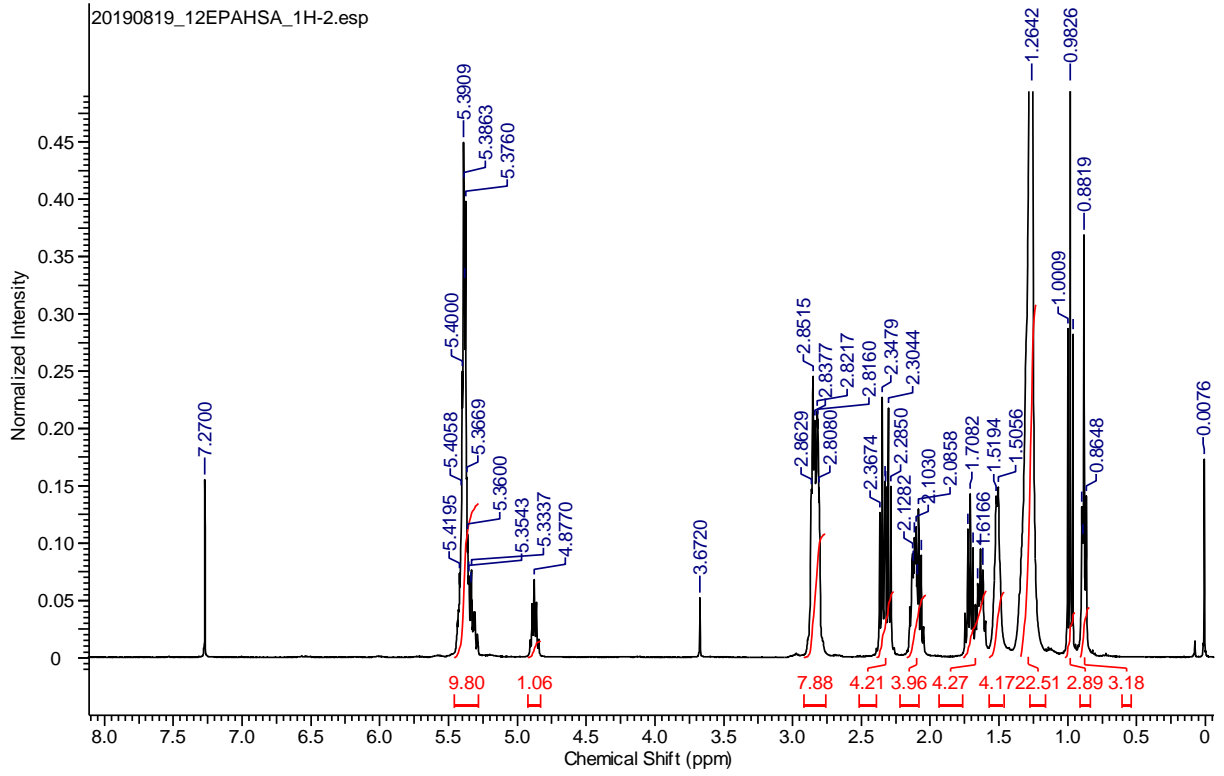

¹H and ¹³C-NMR of 12-LAHOA (3a)

¹H and ¹³C-NMR of 12-EPAHSA (4)

¹H and ¹³C-NMR of 12-EPAHOA (4a)
