

Figure S8. Modulation of mucosal and systemic cytokine profiles by ALVAC and ALVAC/AIDSVAX. Volcano plots of cytokines measured 1 or 2 weeks after each vaccination in (a, b, c, d) cervical and (e, f, g, h) rectal culture supernatants or (i, j, k, l, m, n, o, p) in serum in comparison to cytokine levels measured at baseline week -4 (control). FC: fold change. Horizontal dotted line indicates a P value of 0.05. Analytes above this line are significantly modulated. Vertical dotted line is set at a Log₂FC = 0. Data shown are mean from triplicates for each macaque (n=6).
