

**Supplementary Figure S1.** The sLnAg immunoblot membrane with serum from CL cured patients. Lane 0: molecular weight range. Lane 1 to 11, 13 and 15 to 18: sLnAg extract immunoblotted with serum from CL cured patients. Lanes 12 and 14: sLnAg extract immunoblotted with serum from mucosal leishmaniasis patients (not included in our analysis). Positive control: lanes 19 and 20 (immunoblot incubated with serum samples from active cutaneous leishmaniasis ) and negative control: lanes 21 and 22 ( incubated with sera samples from patients without leishmaniasis clinic evidence). Lanes 12, 14, 21 and 22 have been removed from the figure 2 because they were from patients with the most severe clinical form of the disease.
