

Figure S1. Anti-Spike IgG subclass reactivity at 14 days post vaccination. Six-week-old BALB/c mice ( $n = 5/\text{group}$ ) received immunizations with  $10^{10}$  vp of an Ad-vectored vaccine. Sera were collected at 14 days post vaccination and IgG1 and IgG2a anti-S was detected by ELISA. (a) Optical density at 450 nm determined by ELISA of a 1:50 dilution of the sera. (b) IgG2a/IgG1 ratio. The box plots show median, 25th and 75th percentiles and the whiskers show the range. \*\* $P < 0.01$ ; two-tailed Mann-Whitney U test.
