<b>Alcohol (units/week)</b>	1.7 [1.0;2.3]	0.6 [0.0;1.2]	1.3 [0.8;1.7]	1.1 [0.2;2.0]	0.05	0.53	0.37

Normally distributed data and data that were normally distributed after log transformation (fasting plasma glucose, visceral fat mass, HDL, triglycerides, GGT and fasting glucagon) were analyzed with one-way ANOVA. Data that were not normally distributed after log transformation (FLI and alcohol intake) were analyzed using the non-parametric Kruskall-Wallis test with Dunn's multiple comparisons post hoc test. ALT, alanine aminotransferase; AST, aspartate aminotransferase; CAP, continuous attenuation parameter; FLI, fatty liver index; GGT, gamma glutamyl-transferase; HOMA<sub>IR</sub>, homeostasis model assessment 2; sCD163, soluble CD163; sMR, soluble mannose receptor.

**Table S2.** Changes from baseline to year one for subgroups with and without NAFLD.

------------------------------------	-----------------------------------	----------------------------------	----------------------------------	---------------------------------	------	------	------

Normally distributed data are mean and [95% CI] and if zero is not included in the 95% CI, the change is significant. Log transformed data are ratio and [95% CI] and if one is not included in the 95% CI, the change is significant. Normally distributed data (if necessary after log-transformation) are analyzed with unpaired t-test with Welch's correction. Log-transformed parameters: total cholesterol, triglycerides, VLDL and visceral fat mass. Alcohol intake is median with (IQR). These data are non-normally distributed and are analyzed using Mann-Whitney's U-test. HOMA<sub>IR</sub>, homeostasis model assessment.
