NCBI accession number, primers sequences and expected product sizes are included.

**Figure S1.** Validation (at mRNA and protein levels by qPCR and Western blot) of GPR107-silencing in androgen-independent PCa cell line 22Rv1 after 48 h of GPR107 siRNA transfection. mRNA levels of *GPR107* were determined by qPCR and adjusted by *ACTB* expression levels. GPR107 protein level was normalized by B-Tubulin (TUBB) protein levels. Data were represented as percent of scrambled cells (set at 100%). Asterisks (\* p <0.05; \*\* p <0.01) indicate statistically significant differences between GPR107-silencing and scrambled cells.

**Figure S2.** Correlation between *GPR107* expression levels and different key oncogenic factors in primary PCa samples from patients with metastasis. Correlation of *GPR107* expression level and *SST<sub>5</sub>TMD4* (A), *SST<sub>5</sub>* (B), *In1-Ghrelin* (C) and *AR-v7* (D) expression in primary PCa samples from patients with metastasis (cohort 2). mRNA levels were determined by qPCR and adjusted by *ACTB* expression levels or by normalization factor (NF) generated by the combination of *ACTB* and *GAPDH* expression levels.

**Figure S3.** Comparison of GPR107 expression levels between non-Tumoral (N), primary tumor (PT), mHSPC specimens (M) obtained from three in silico databases (Lapointe, Taylor and Tomlins). The Y-axis represents the Log2-normalized gene expression. An ANOVA test is performed in order to compare the mean gene expression among groups.
