

Supplementary Figure S4: Directional differences in retinal thickness

Supplement to *Prediction of function in ABCA4-related retinopathy using ensemble machine learning*

The density plots show the distributions of the full retinal thickness of patients (red) and controls (cyan). In all directions, patients revealed thinner retinal thickness ($P < 0.001$), which was most and least expressed in the nasal (D) and superior (A) ETDRS subfields, respectively. Of note, the nasal full retina thickness also revealed the overall highest values.
