**Figure S1.** (a) Chemical structures of gelatin and GelMA, and (b) <sup>1</sup>H NMR spectra of gelatin and GelMA.

GelMA was synthesized according to Lai's work with minor modifications [1]. Briefly, 10 g gelatin was dissolved in 100 ml PBS at 50 °C. 6 ml MA was then added into the gelatin solution and stirred for 3 to 4 h. Afterwards, the mixture was dialyzed (MW 12 KDa cut-off) for a week at 50 °C. Finally, the solution was freeze-dried and kept at -20 °C until use.

<sup>1</sup>H NMR spectra were recorded on a Bruker Avance III 400 spectrometer (400 MHz) at 25 °C, using D<sub>2</sub>O (δ(<sup>1</sup>H) = 4.79 ppm) as solvent. The degree of substitution (DS) of GelMA was calculated to be 60.69% (Figure S1).

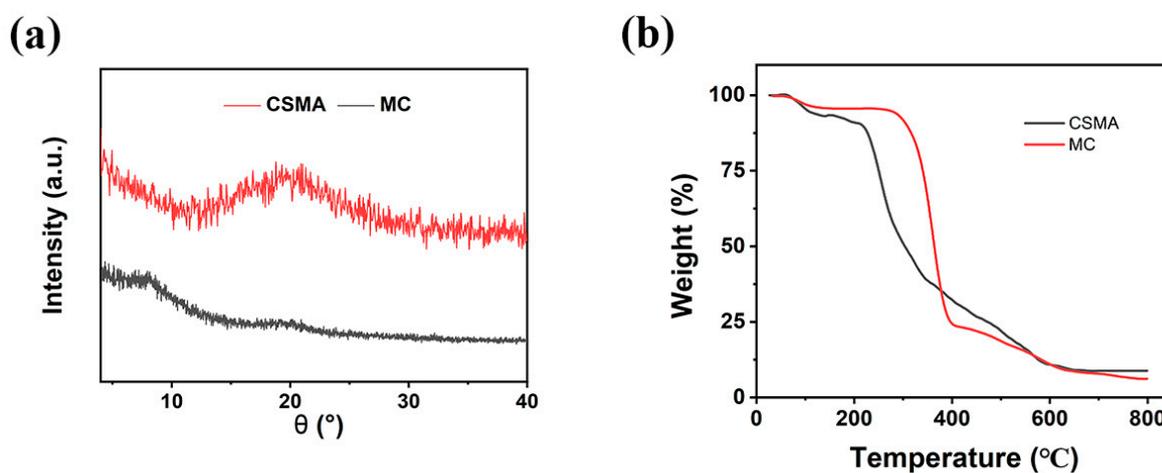

Figure S2. a) XRD patterns and (b) TGA curves of CSMA and MC raw materials.

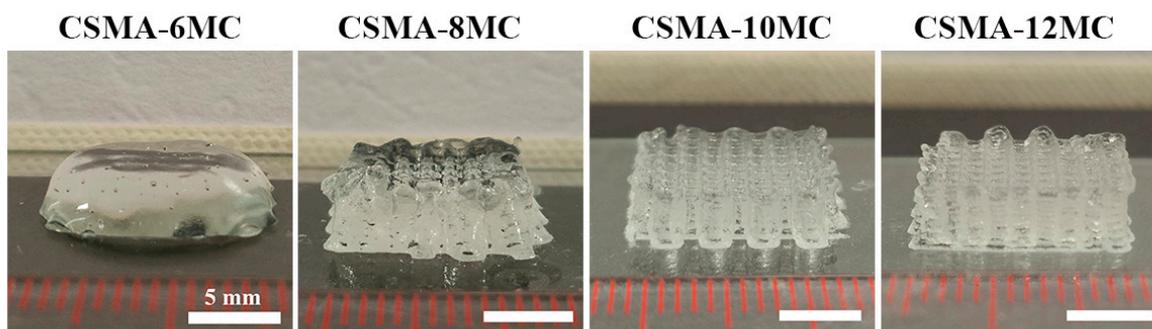

Figure S3. Front views of 3D printed 10-layer hydrogel blend grid structures using different inks.

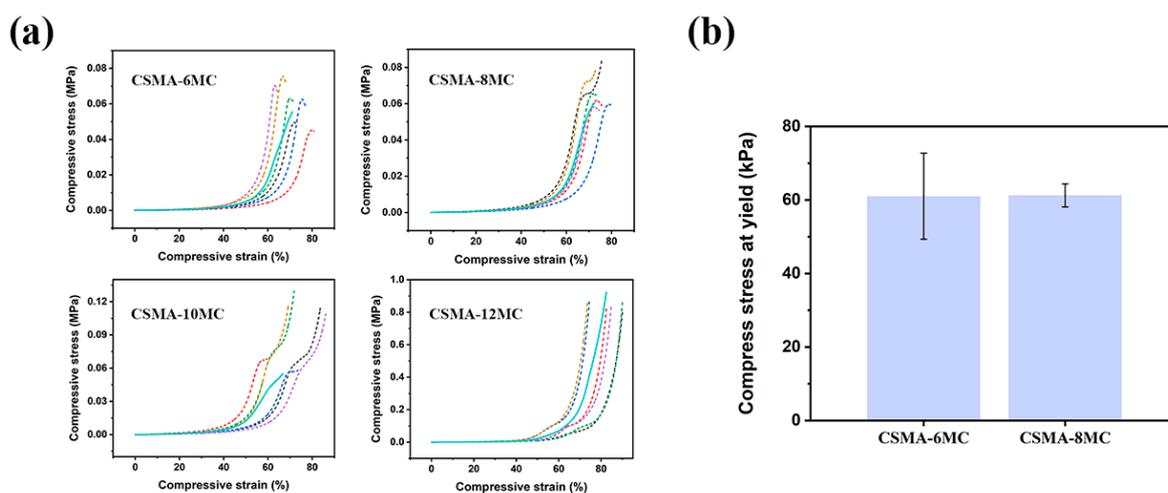

Figure S4. a) Compressive stress-strain curves of hydrogel samples with different MC concentrations. (The dash curves were individual samples, and the solid curves were the average curves of all tested samples) (b) Compressive stress at yield for CSMA-6MC and CSMA-8MC.

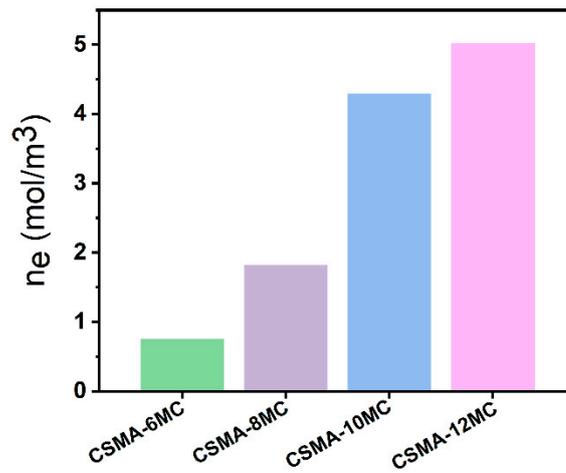

Figure S5.  $n_e$  values of blend hydrogels calculated from frequency sweep results of rheological tests.

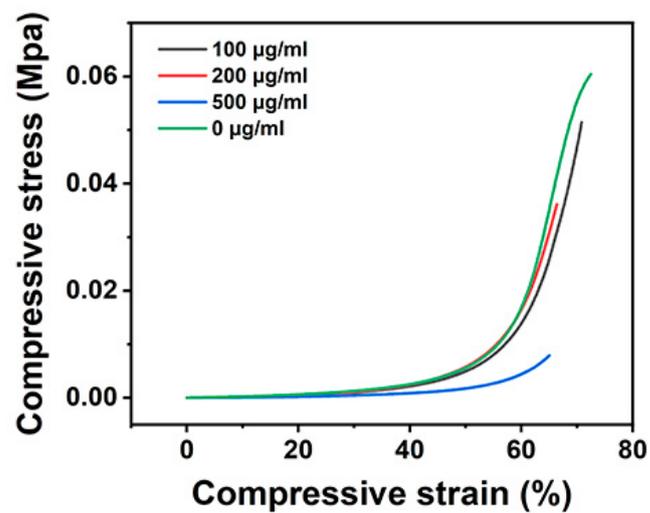

Figure S6. Compressive strain-stress curve of hydrogel blends having different DOX concentrations.
