**Figure S1:**  $P$ - $h$  plots at  $P_{\max} = 200$  mN along along NR, RW and NW; (a) CR0, (b) CR4.5, (c) CR10, (d) CR20 and (e) CR31, pop-in events are more pronounced in CR0, which gradually decreases with the increase of cold rolling strain.

**Figure S2:**  $P$ - $h$  plots at  $P_{\max} = 100$  mN along NR, RW and NW; (a) CR0, (b) CR4.5, (c) CR10, (d) CR20 and (e) CR31, pop-in events are more pronounced in CR0, which gradually decreases with the increase of cold rolling strain.

**Figure S3:**  $P$ - $h$  plots at  $P_{\max} = 50$  mN along NR, RW and NW; (a) CR0, (b) CR4.5, (c) CR10, (d) CR20 and (e) CR31, pop-in events are more pronounced in CR0, which gradually decreases with the increase of cold rolling strain.
