S1. Catalytic Experiment for CO₂ Photoreduction

Photocatalytic activity for CO₂ reduction with water vapor was evaluated in a stainless-steel cylindrical vessel with a length of 15 cm and a volume of 180 mL, and the light source was a 300 W Xenon arc lamp (PLS-SXE 300, Beijing Trust tech Co. Ltd., China) with a UV cutoff filter ($\lambda > 400$ nm). The catalyst was put on a glass sheet (1.8 × 2 cm) equipped with a quartz window. Before lighting, the reaction setup was vacuum-treated, and then high purity CO₂ gas (99.995%) was purged into the reaction system several times. The compressed high purity CO₂ gas passed through a water bubbler to generate a mixture of CO₂ and H₂O vapor. After illumination, the gaseous products were quantifiably identified by offline analysis using a GC-7890II gas chromatograph (Techcomp Corp., China) equipped with FID and TCD detectors, and the columns were TDX-01 and Porapak-Q, respectively. Then, the hydrocarbon product was further analyzed by GC-MS (Agilent 7890A-5975C) equipped with a DB-FFAP capillary column. In order to evaluate the stability of the synthesized composites, the Cu/Cu₂O/WO₃ model sample was refreshed by electrochemical treatment before washing and drying, and its photocatalytic performance was reassessed.

Table S1. ICP-AES analysis of Cu₂O/WO₃ and Cu/Cu₂O/WO₃ samples.

Sample	Ratio of Cu/W atoms (%)
WO ₃	0.00
Cu ₂ O/WO ₃	16.66
Cu/Cu ₂ O/WO ₃	18.22
Cu/Cu ₂ O	100
Cu ₂ O	100

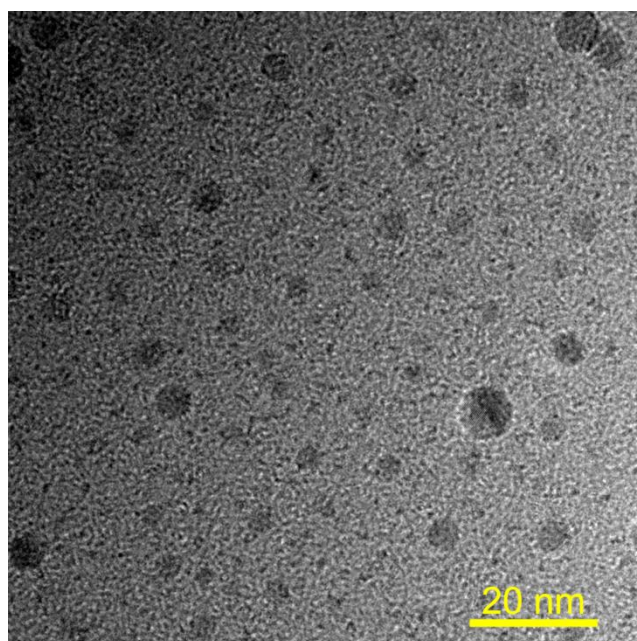

Table S2. Band gaps of pure WO₃, Cu₂O, Cu₂O/WO₃ and Cu/Cu₂O/WO₃ samples.

Sample	Band gap(eV)
WO ₃	2.83
Cu ₂ O/WO ₃	2.32*
Cu/Cu ₂ O/WO ₃	2.09*
Cu ₂ O	2.03

* The above value was apparent band gap of the sample.
