SUPPLEMENTARY FIGURES

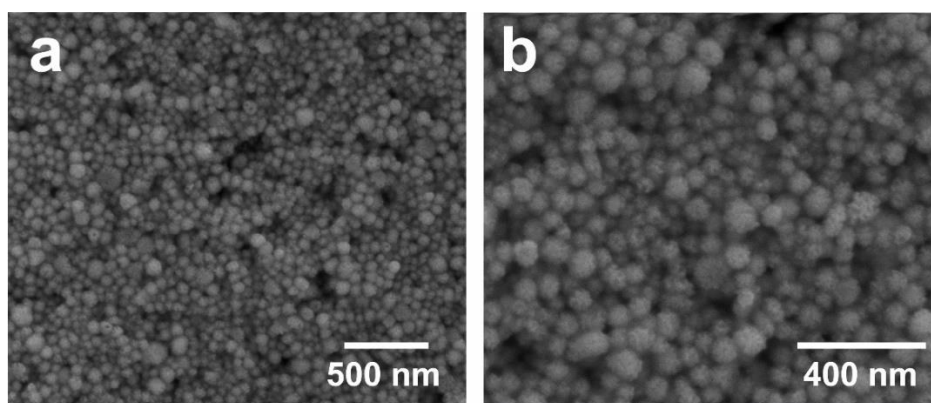

Figure S1. Scanning Electron Microscopy (SEM) images of the Au@Pt nanozyme at different magnifications.

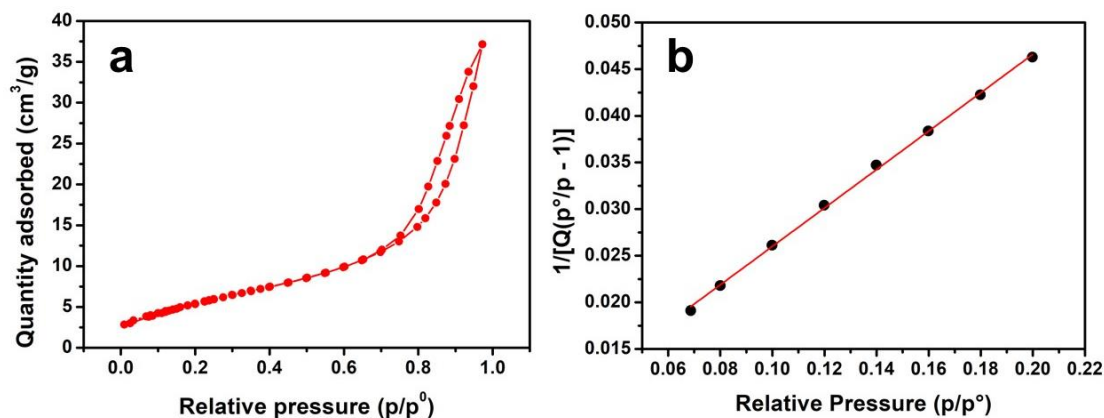

Figure S2. (a) N₂ adsorption isotherm at 77 K and (b) Brunauer-Emmett-Teller (BET) analysis of the Au@Pt nanozyme.

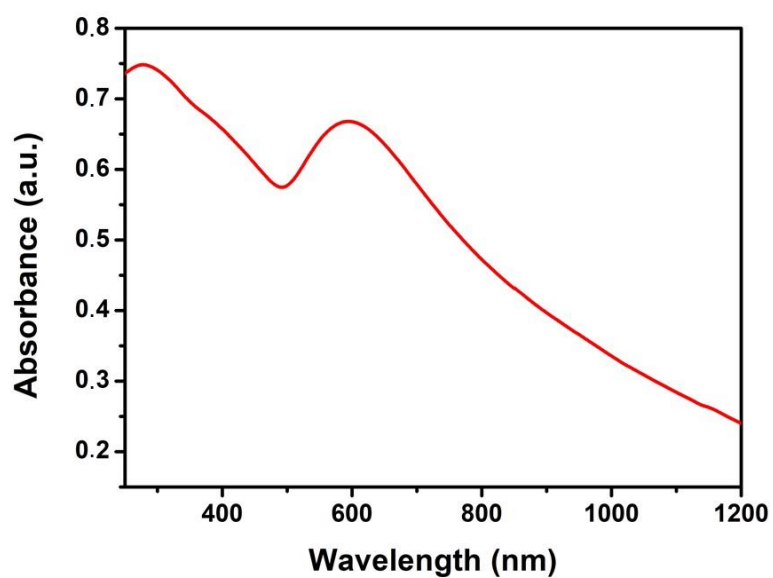

Figure S3. UV-vis spectrum of the Au@Pt nanozyme.

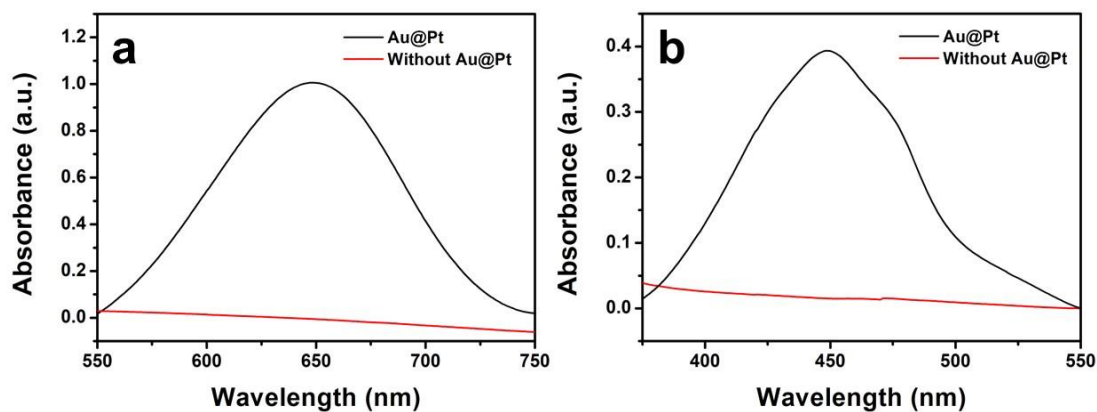

Figure S4. UV-vis spectra to evaluate the oxidation of (a) TMB and (b) OPD substrates in the absence (control experiment) and in the presence of the Au@Pt nanozymes; Reaction time in the control experiment was fixed at 1 hour.

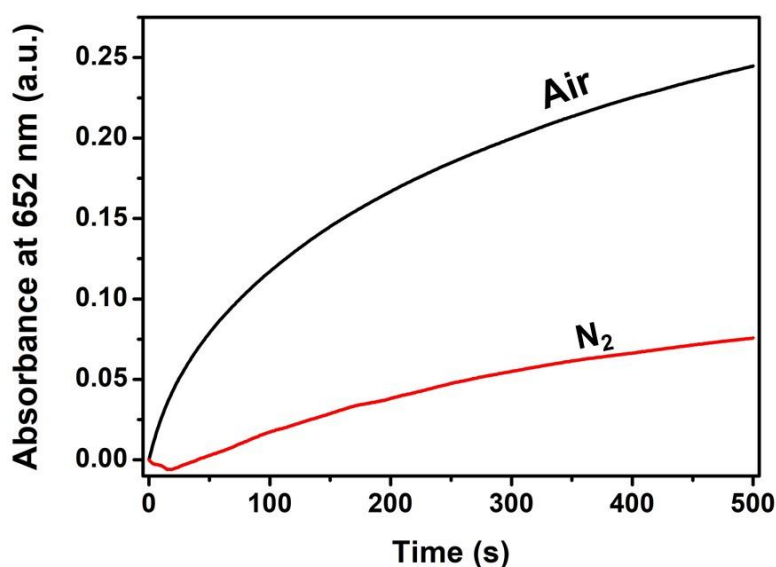

Figure S5. Influence of O₂ on the oxidase-like response of the Au@Pt nanozyme versus TMB: Evolution of the maximum absorbance peak at 652 nm at different reaction times in the presence (black line) or absence (red line) of O₂.

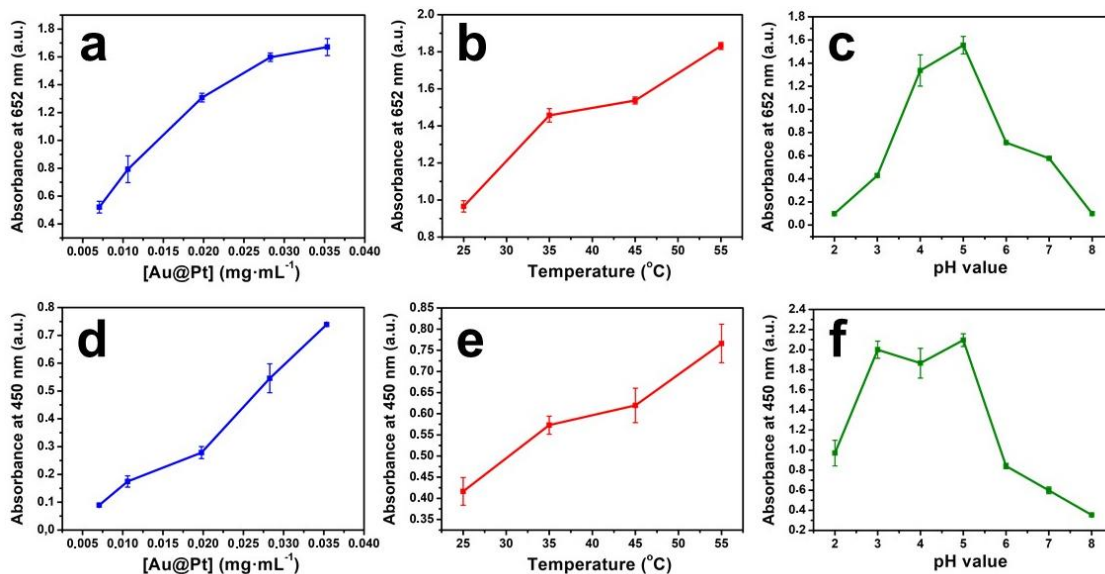

Figure S6. Influence of different parameters in the oxidase-like response of the Au@Pt nanozyme: (a,d) Nanozyme concentration; (b,e) temperature; (c,f) and pH for TMB (row from a to c) and OPD (row from d to f); Experimental conditions: Reaction time = 10 minutes. Temperature value for Figure S6_{a,c,d,f} = 25 °C; pH for Figure S6_{a,b,d,e} = 4.0 (adjusted with CH₃COOH/CH₃COONa buffer) and Au@Pt concentration for Figure S6_{b,c,e,f} = 0.02 mg×mL⁻¹.

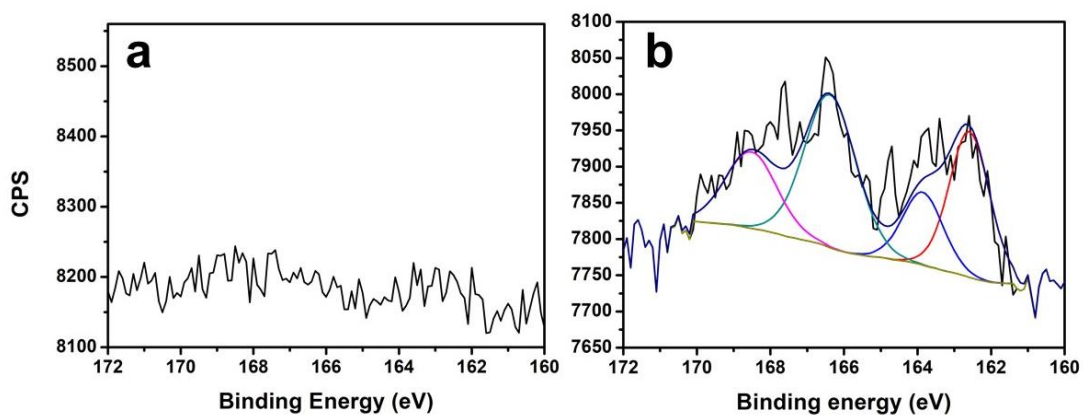

Figure S7. X-ray photoemission spectra of the S2p region (a) before and (b) after incubation of Au@Pt with GSH. The atomic percentage of S on the surface increased up to 2.5%.

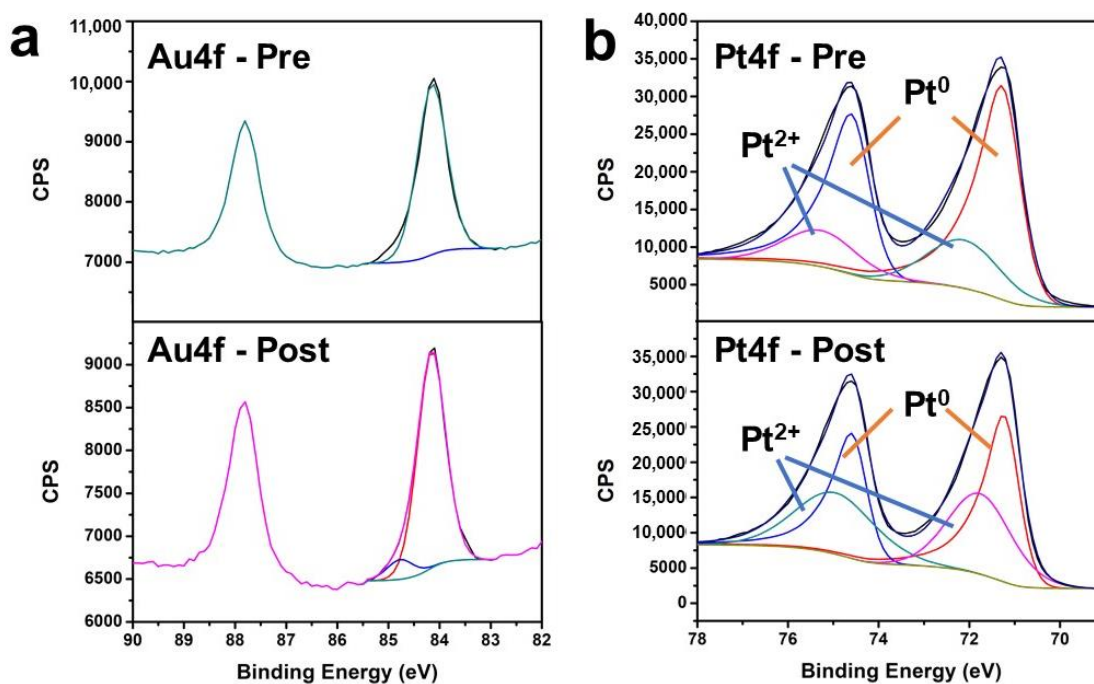

Figure S8. X-ray photoemission spectra of the (a) Au4f and (b) Pt4f regions before and after the incubation of Au@Pt nanozyme with GSH.
