

3.1 SEM

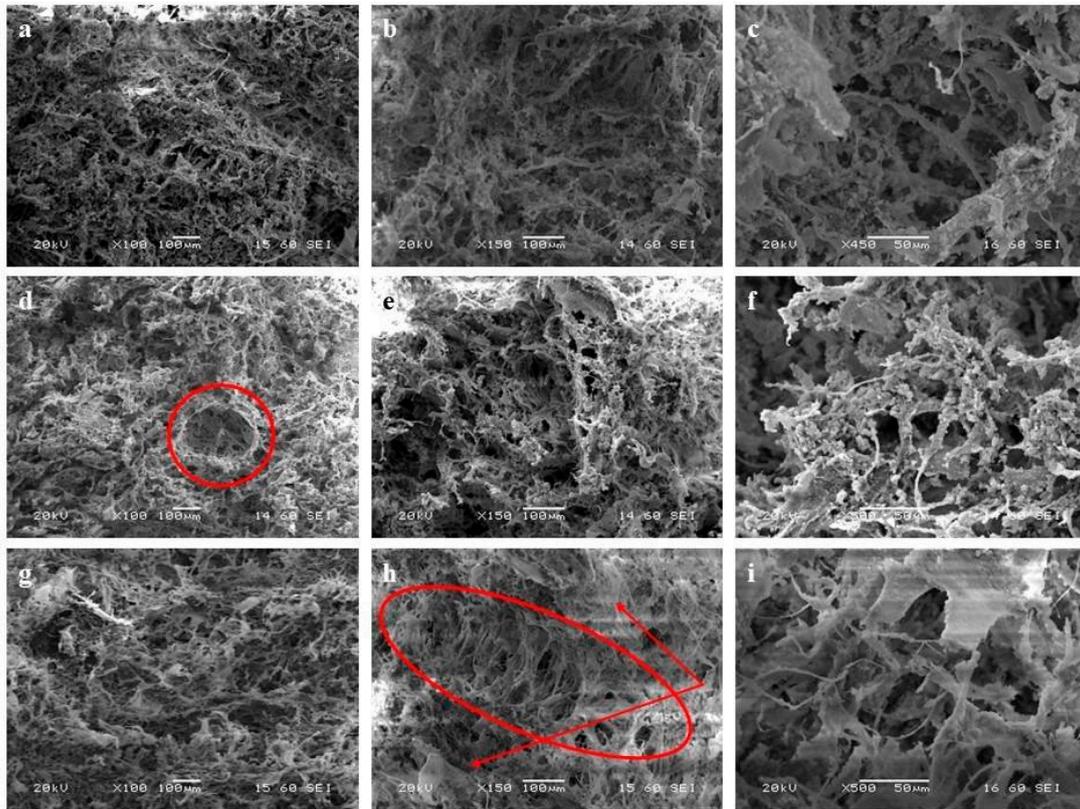

Figure S1: SEM Images of the composite HAP–CeO₂ scaffolds. (a), (b), (c) 1S – 4 % CeO₂, (d), (e), (f) 1S – 5 % CeO₂, (g), (h), (i) 1S – 10 % CeO₂.

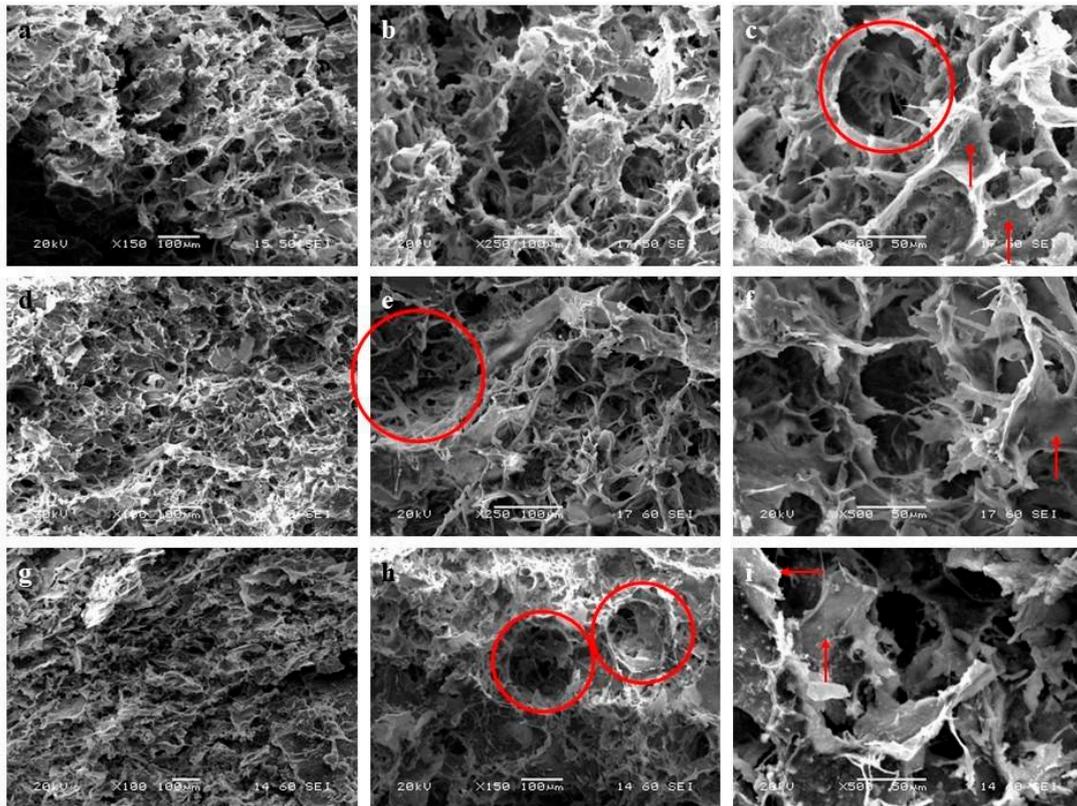

Figure S2: SEM Images of the composite HAP–CeO₂ scaffolds. (a), (b), (c) 2S – 4 % CeO₂, (d), (e), (f) 2S – 5 % CeO₂, (g), (h), (i) 2S – 10 % CeO₂.

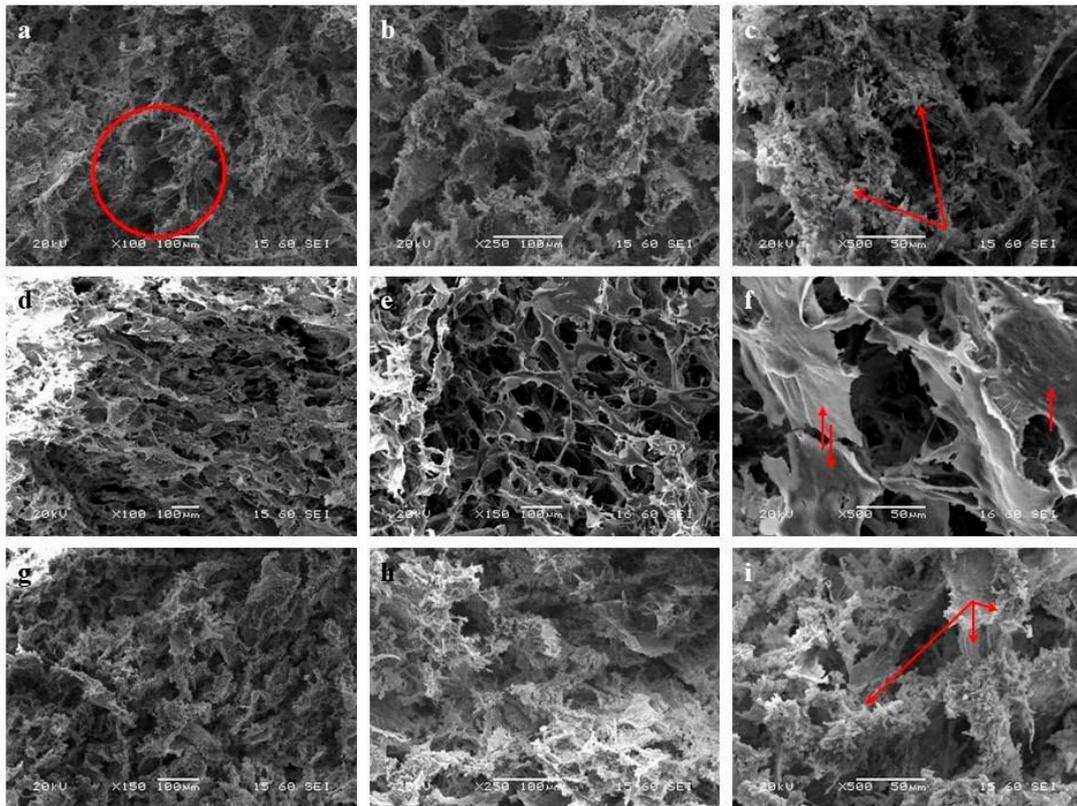

Figure S3: SEM Images of the composite HAP–CeO₂ scaffolds. (a), (b), (c) 3S – 4 % CeO₂, (d), (e), (f) 3S – 5 % CeO₂, (g), (h), (i) 3S – 10 % CeO₂.

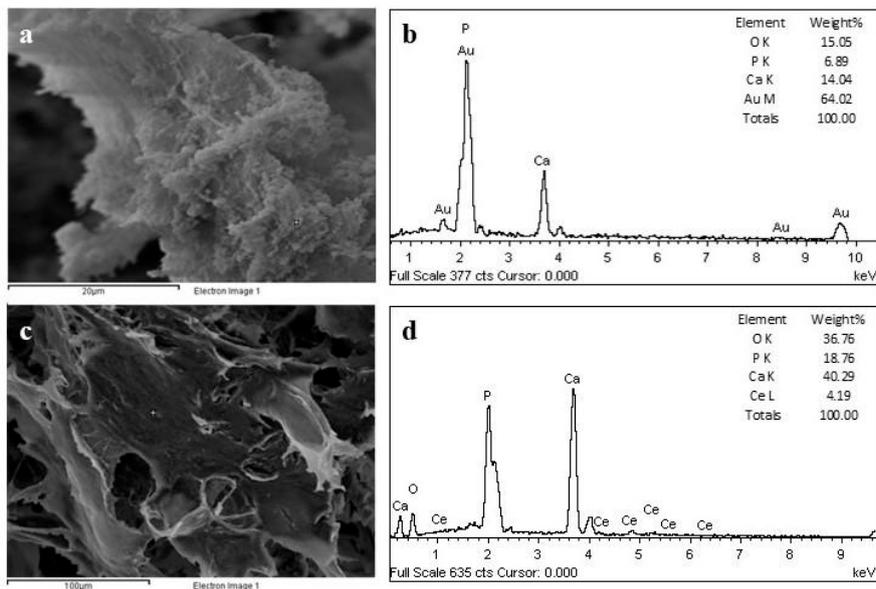

Figure S4: SEM images and EDS spot analyses. Detected phase of (a), (b) CDHA and (c), (d) HAP.

3.5 DMA

After DMA analyses the microstructural characteristics of some of the tested scaffolds are examined via SEM (Fig. S5). It is noted that the periodic growth of dense-porous zones in the 1S – 10 % CeO₂ sample appears to have been preserved even after the application of the test loads (Fig. S5b, indicated with red arrows). This microstructural feature can be beneficial as it enables the absorption of a greater amount of energy before collapse of the scaffold. Concerning the 2S – 4 % CeO₂ scaffold microstructure, it is noted that there are areas in which the pores have preserved their original shape (Fig. S5d) and others in which the pores appear to be more closed (Fig. S5e). This is due to the arrangement of the needle-like HAP crystals parallel to the load axis. As a result, the strength of the scaffold is enhanced and its original microstructure is maintained. Finally, phenomena of oriented crystallization in the direction of stress application are observed (Figs. S5f and S5g, indicated with red arrows).

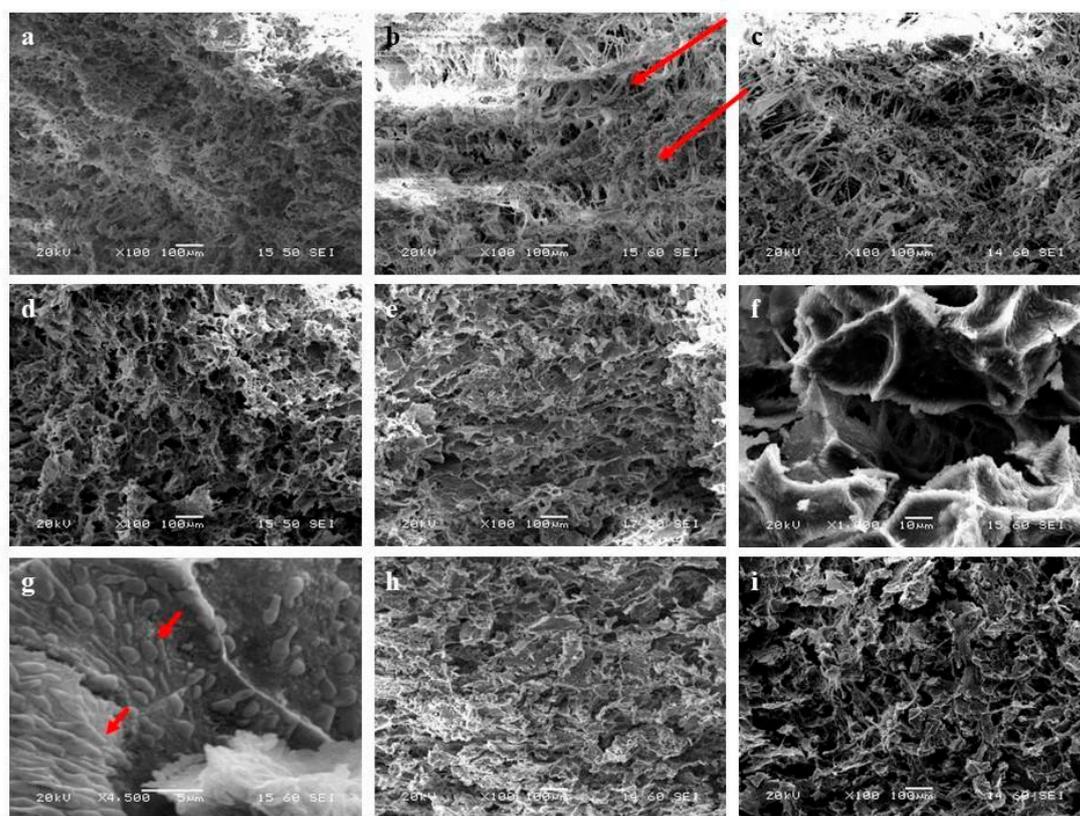

Figure S5: SEM images of composite HAP–CeO₂ scaffolds. (a) 1S – 5 % CeO₂, (b), (c) 1S – 10 % CeO₂, (d), (e), (f), (g) 2S – 4 % CeO₂, (h) 2S – 5 % CeO₂, (i) 2S – 10 % CeO₂.

3.6 UCT and cyclic loading

Table S1: Modulus of Compression E_i (MPa) and Energy Absorption per unit volume EA_i (mJ/mm^3) of each of the examined HAP- CeO_2 composite scaffolds i ($i=1, 2, 3$) and of HAP reference scaffolds.

sample	E_i (MPa)			EA_i (mJ/mm^3)
