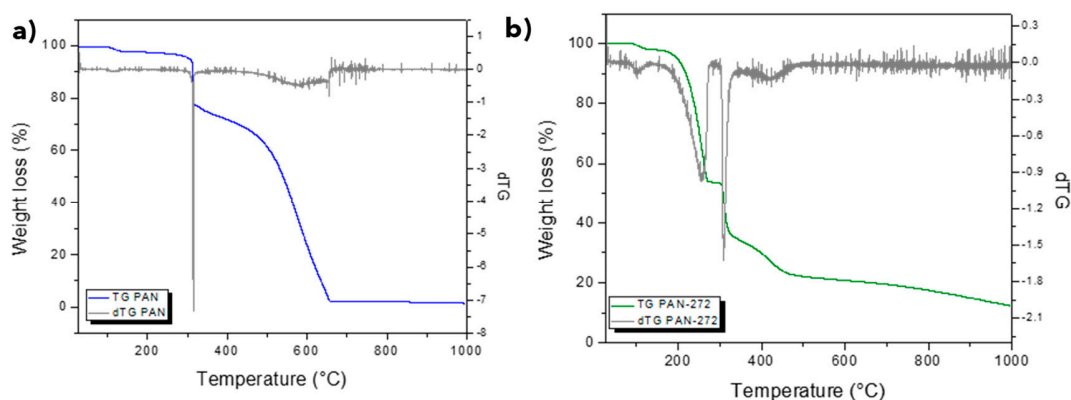

Figure S1. Thermograms and the first derivate of PAN and PAN-272

Table S1. Weight loss of PAN and PAN- 272 nanofibers membranes

Temperature range (°C)	PAN-272(%)	PAN (%)
<150	2.08	1.7
145-284	44.3	---
280-350	20.2	20.7
350-450	10.9	75.9
>450	10.0	

Kinetic fitting

The kinetic model of pseudo-first order has been widely used to predict adsorption kinetics. The model given by Lagergren is defined as:

$$q_t = q_e (1 - e^{-k_1 t}) \quad (S1)$$

Integrating equation (S1) with respect to the boundary conditions $q_t = 0$ to $t = 0$ and $q_t = q_e$ to $t = t$:

$$\log(q_e - q_t) = \log q_e - \frac{k_1}{2.303} t \quad (S2)$$

where k_1 is the pseudo first order constant (min^{-1}); q_t and q_e are the adsorption capacities of the ion-selective nanofibers at time t and at equilibrium respectively and t (min) is the contact time.

The pseudo second order equation based on equilibrium adsorption is expressed as:

$$q_t = \frac{q_e^2 k_2 t}{1 + q_e k_2 t} \quad (S3)$$

Integrating equation (3) with respect to the boundary conditions $q_t = 0$ to $t = 0$ and $q_t = q_e$ to $t = t$:

$$\frac{t}{q_t} = \frac{1}{q_e^2 k_2} + \frac{t}{q_e} \quad (S4)$$

Where k_2 is the pseudo second order constant ($\text{g mg}^{-1} \text{min}^{-1}$); q_t and q_e are the adsorption capacities of the ion-selective nanofibers at time t and at equilibrium respectively and t (min) is the contact time.
