

Supplemental Materials:

Supplemental materials for “Computationally Designed AMPs with Antibacterial and Antibiofilm Activity against MDR *Acinetobacter baumannii*” By Fahad M. Alsaab, Scott N. Dean, Shravani Bobde, Gabriel G. Ascoli and Monique L. van Hoek

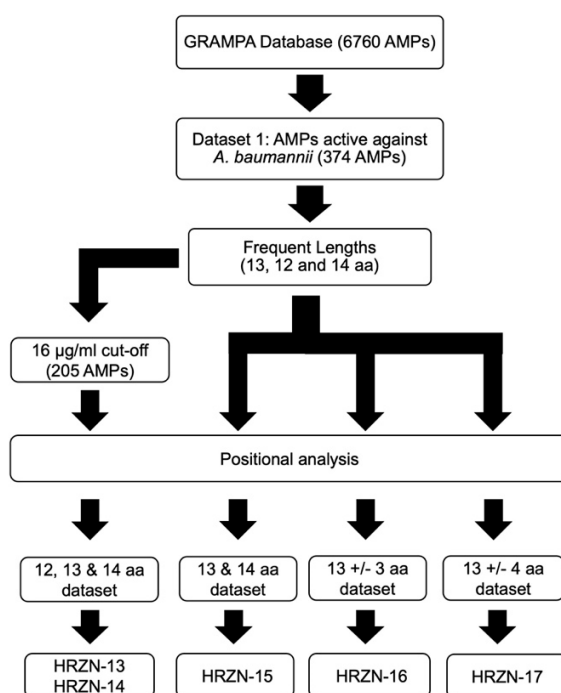

Figure S1. Flowchart of DFT plus positional analysis (PA) method used to design HRZN peptides.

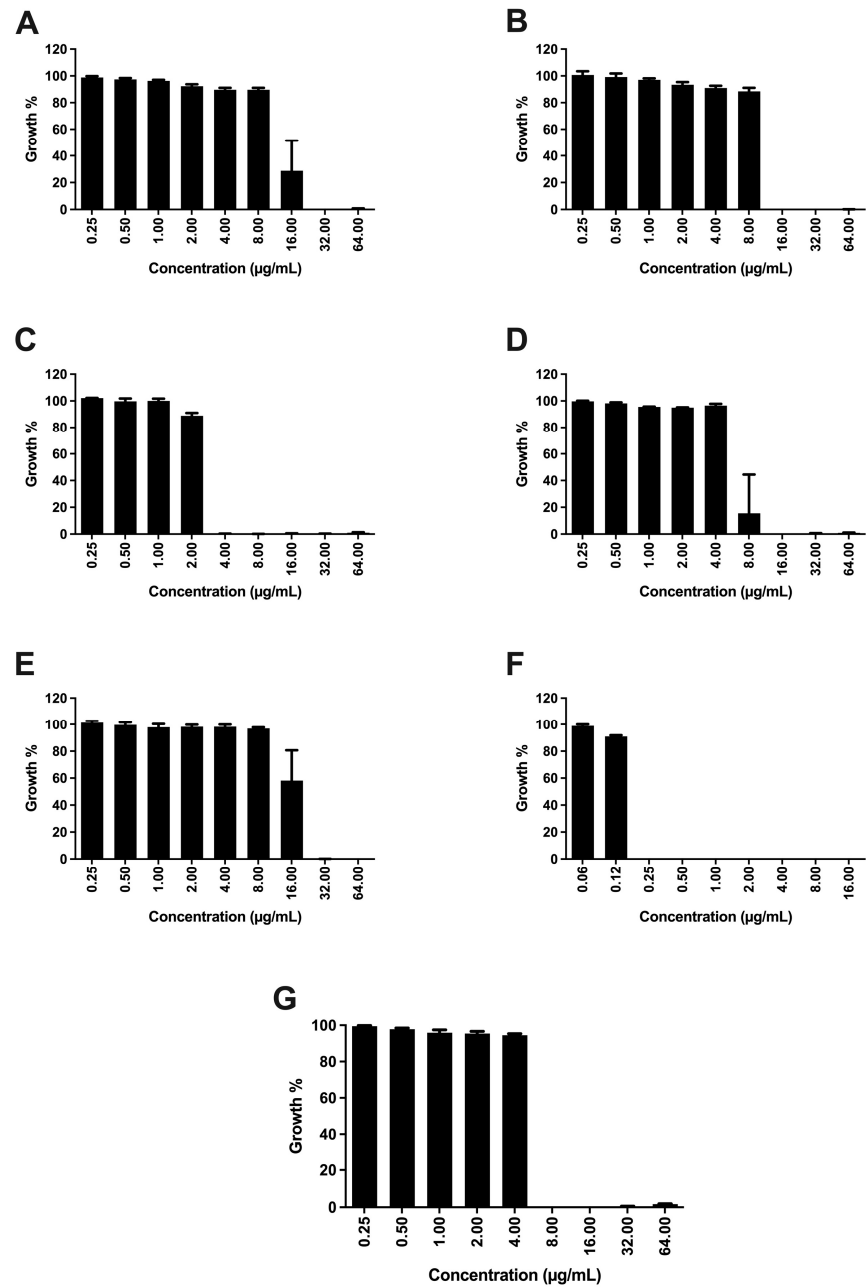

Figure S2. Minimum inhibitory concentration (MIC) of peptides against *A. baumannii* AB5075. (A) HRZN-13, (B) HRZN-14, (C) HRZN-15, (D) HRZN-16, (E) HRZN-17, (F) polymyxin B and (G) LL-37 resulted in MIC of 32, 32, 4, 16, 32, 0.5 and 8 µg/mL, respectively.

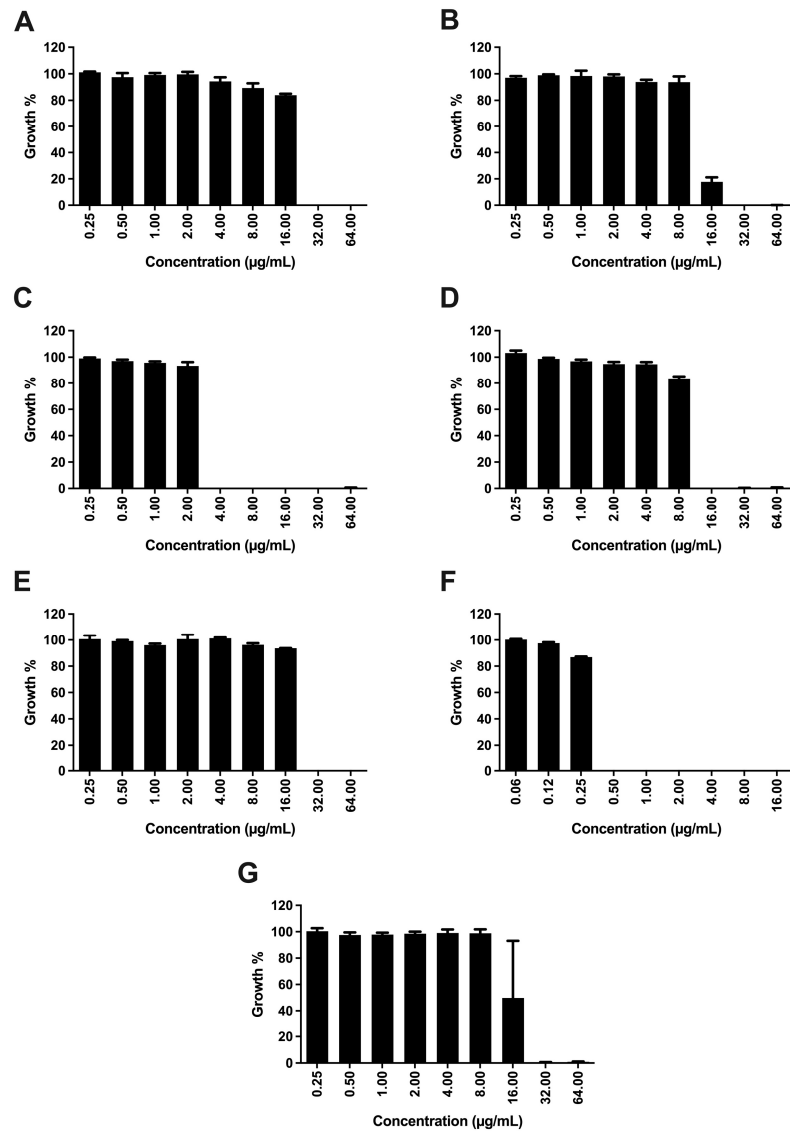

Figure S3. Minimum inhibitory concentration of peptides against *A. baumannii* BAA-1710. (A) HRZN-13, (B) HRZN-14, (C) HRZN-15, (D) HRZN-16, (E) HRZN-17, (F) polymyxin B and (G) LL-37 resulted in MIC of 32, 32, 4, 16, 32, 0.5 and 32 µg/mL, respectively.

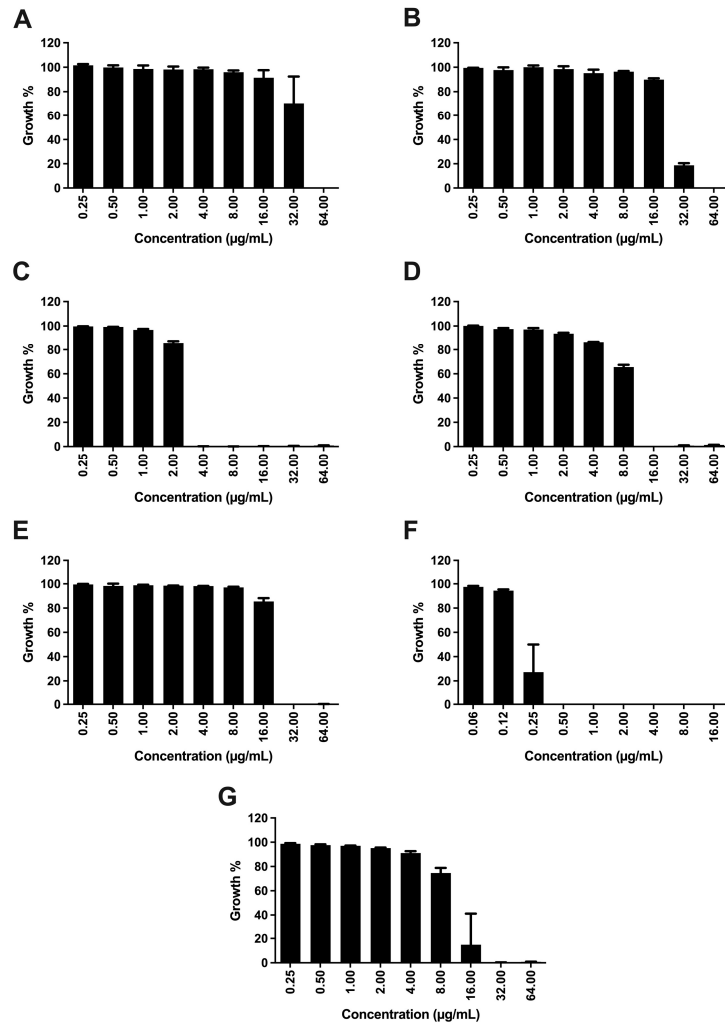

Figure S4. Minimum inhibitory concentration of peptides against *A. baumannii* BAA-1794. (A) HRZN-13, (B) HRZN-14, (C) HRZN-15, (D) HRZN-16, (E) HRZN-17, (F) polymyxin B and (G) LL-37 resulted in MIC of 64, 64, 4, 16, 32, 0.5 and 32 µg/mL, respectively.

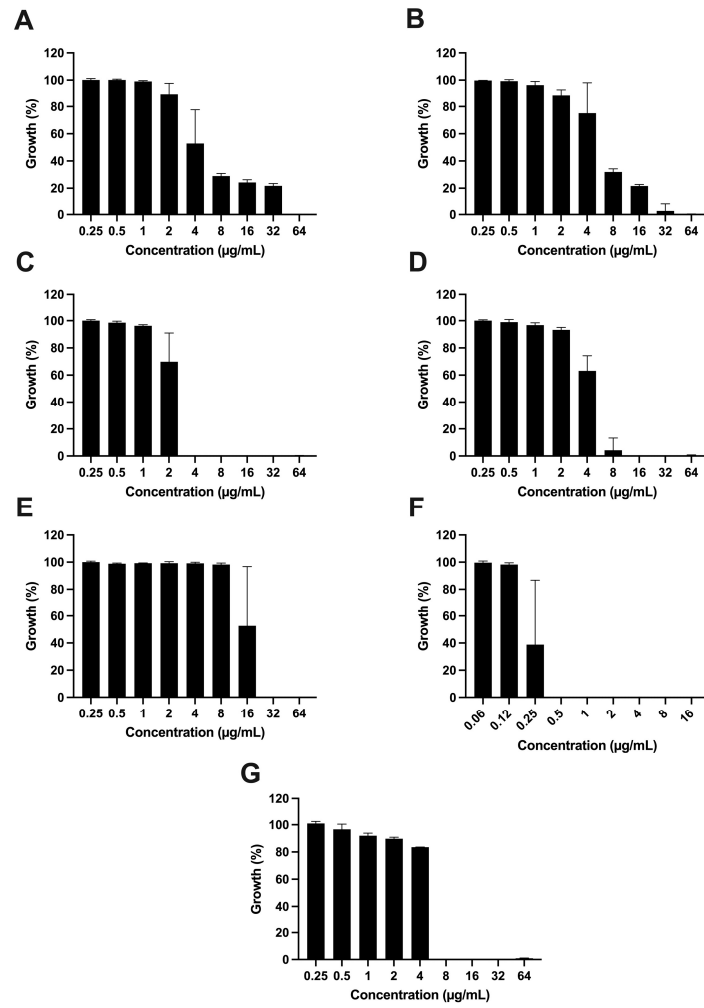

Figure S5. Minimum inhibitory concentration of peptides against *A. baumannii* BAA-1800. (A) HRZN-13, (B) HRZN-14, (C) HRZN-15, (D) HRZN-16, (E) HRZN-17, (F) polymyxin B and (G) LL-37 resulted in MIC of 64, 64, 4, 16, 32, 0.5 and 8 µg/mL, respectively.

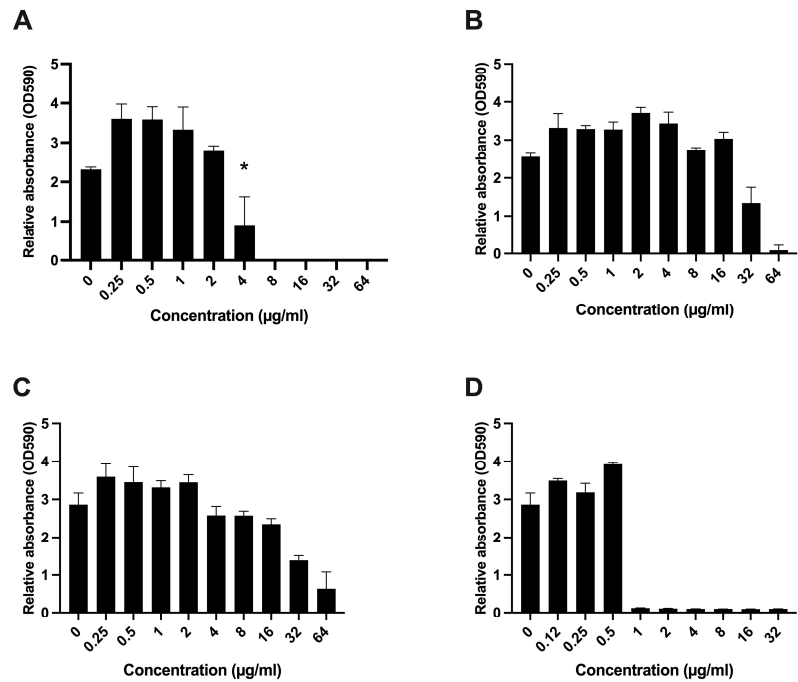

Figure S6. Minimum biofilm inhibition concentration (MBIC) of (A) HRZN-15, (B) LL-37, (C) IDR-1018 and (D) polymyxin B against *A. baumannii* BAA-1800. Biofilm detection on a polystyrene 96-well plate at 37°C after 24 h of growth in TSB was detected as the absorbance of crystal violet stain (590 nm). Percent biofilm production is indicated (n=3), relative to “0 peptide/antibiotic” control. Asterisk * indicates $P < 0.05$ (unpaired t-test).

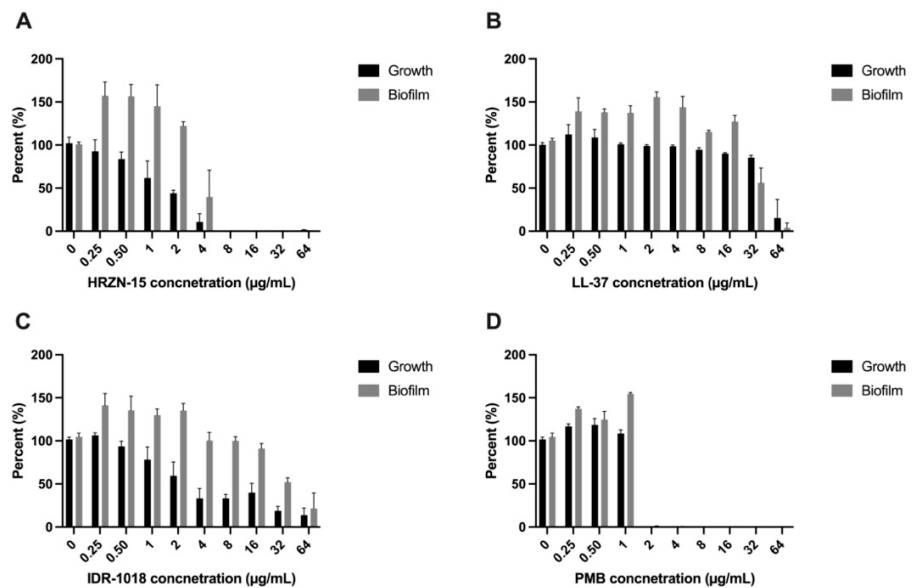

Figure S7. Minimum biofilm inhibition concentration (MBIC) of (A) HRZN-15, (B) LL-37, (C) IDR-1018 and (D) polymyxin B against *A. baumannii* BAA-1800. Panels indicate bacterial growth (absorbance at 600 nm) represented in black bars with “0 peptide/antibiotic” control set to 100%. Biofilm detection on a polystyrene 96-well plate at 37°C after 24 h of growth in TSB was detected as the absorbance of crystal violet stain (590 nm). Percent biofilm production is indicated by gray bars (n=3), relative to “0 peptide/antibiotic” control.

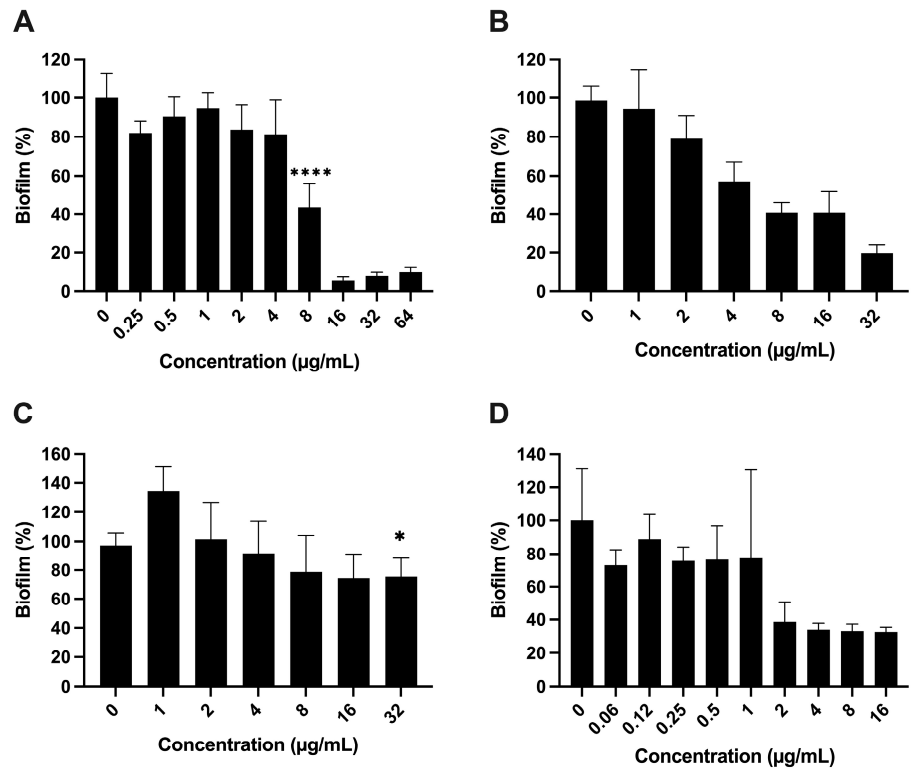

Figure S8. Minimum biofilm eradication concentration (MBEC) of (A) HRZN-15, (B) LL-37, (C) IDR-1018 and (D) polymyxin B against AB5075 (n = 6). Biofilm mass on pegs was detected at the absorbance of crystal violet stain (590 nm). Percentage biofilm mass is calculated relative to “0 peptide/antibiotic” control. The experiment was performed twice. (* $P < 0.05$ and **** $P < 0.0001$).

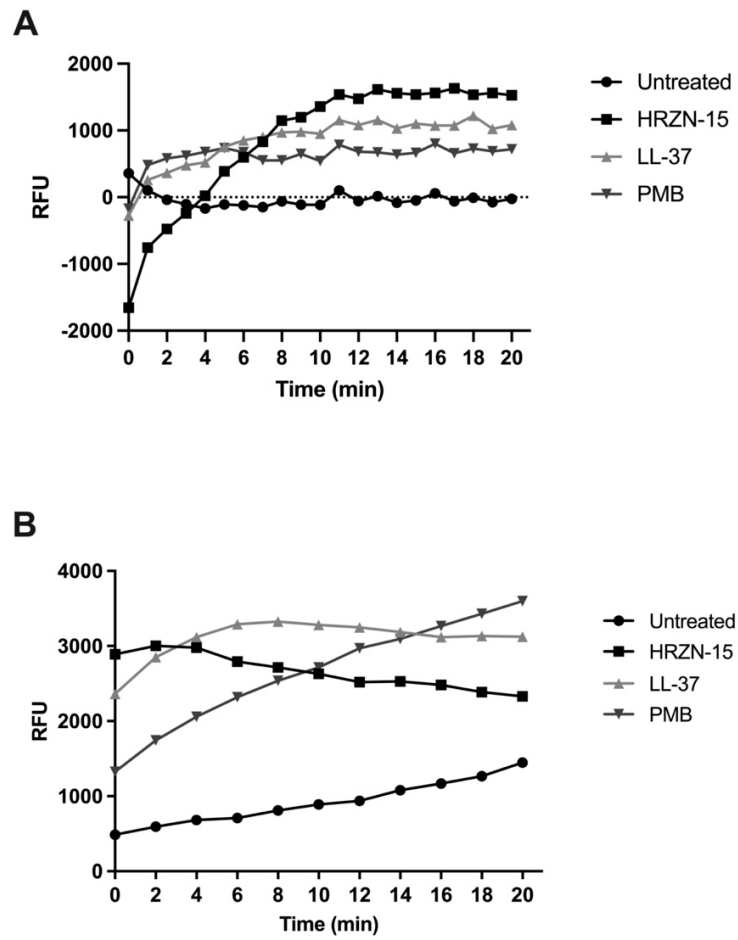

Figure S9. Kinetics of (A) membrane depolarization (DiSC₃(5)) and (B) disruption (EtBr) of HRZN-15, LL-37 and polymyxin B (PMB) against AB5075 upon exposure of 50 $\mu\text{g}/\text{mL}$ of each compound.

Figure S10. *In vitro* resistance acquisition induction of AB5075 upon exposure of HRZN-15 and colistin for 15 days. (A – D) shows consistent MIC values of AB5075 exposed to HRZN-15 on passage 0, 5, 10 and 15 (from top to bottom). (E – H) represents MIC of colistin against colistin-exposed bacteria performed on passage 0, 5, 10 and 15.

Table S1. *A. baumannii*-active peptides from GRAMPA database [43].

Table S2: Dataset 1 containing unique antimicrobial peptides with activity against *A. baumannii*. By removing duplicate sequences from the Table S1 peptide list, we generated **Dataset 1** (374 sequences), and this dataset was used for designing novel HRZN peptides using our “DFT+PA” method.
