Table S2. Clinical characteristics of OS patients and healthy donors (primary cells and PBMCs, respectively).

Parameters		OS patients (n=24)	Healthy donors (n=12)
Median age [range]		19 [5–61]	22 [19–29]
Gender	Male	12 (50.0%)	5 (41.7%)
	Female	12 (50.0%)	7 (58.3%)
Enneking stage	IIB	19 (79.2%)	-
	III	5 (20.8%)	-
Tumor location	Femur	13 (51.2%)	-
	Tibia	6 (25.0%)	-
	Other	5 (20.8%)	-
Metastasis	Bone	1 (4.2%)	-
	Lung	3 (12.5%)	-
	Bone and lung	1 (4.2%)	-
	None	19 (79.2%)	-

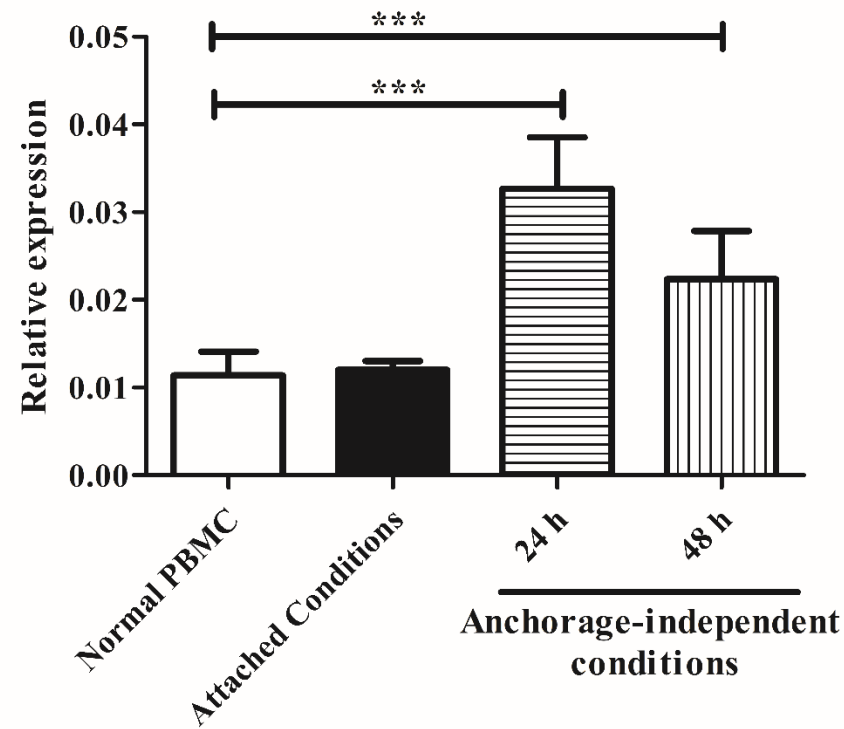

Figure S1. Comparison of the expression of ezrin among normal PBMCs, SaOS-2 (Human OS cell lines) in attached conditions and anchorage-independent conditions. The relative expression of *ezrin* was quantified by qRT-PCR in 12 samples of normal PBMCs and SaOS-2. Expression data were normalized on β -actin RNA level by the $2^{-\Delta C_t}$ method. Each sample was analyzed in triplicate. Data are displayed as vertical scatter plots with bars representing mean \pm SD. The One-Way ANOVA test was used to determine p -values: ***, $p < 0.0001$.

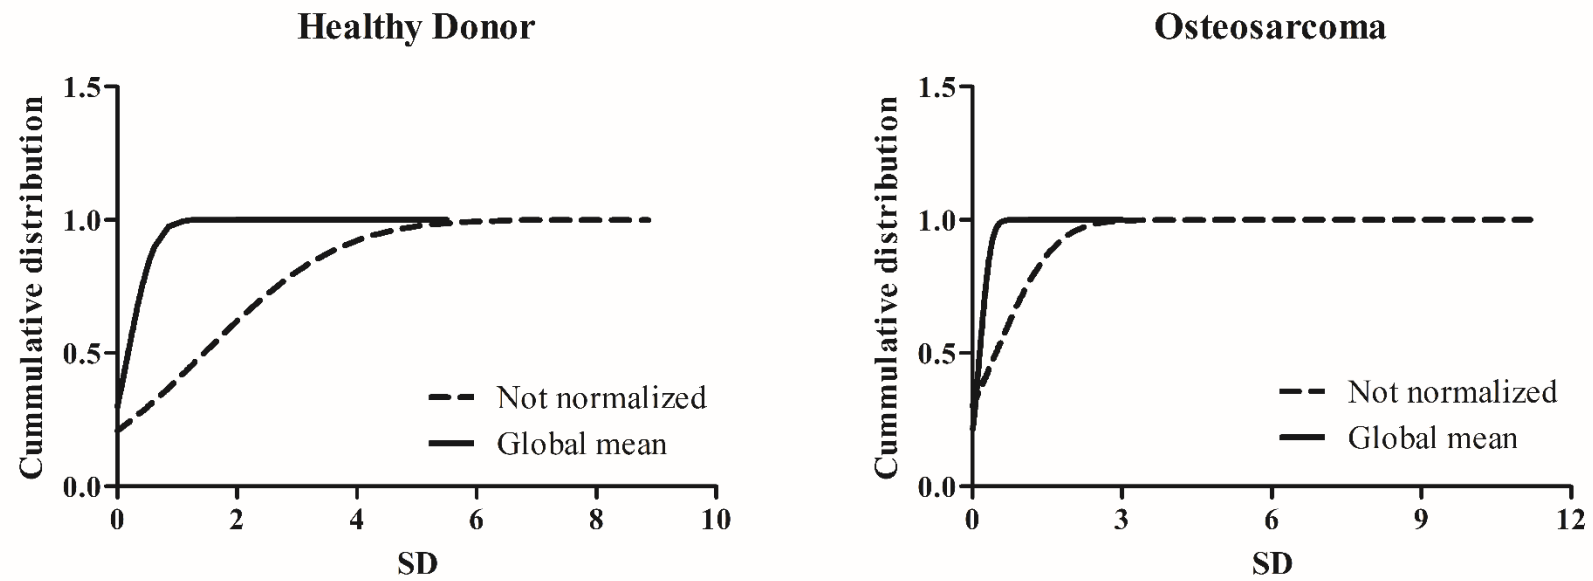

Figure S2. Cumulative distributions (CV) of the standard deviation (SD). Standard deviations (SDs) for each individual gene in the healthy and OS buffy coat samples presented not normalized (- -) and global mean normalized expression data (—).

Materials and Methods

Cell culture as anchorage-independent conditions

To mimic circulating tumor cell condition, Saos-2 osteosarcoma cell line was cultured on 6-well culture plate which coated with 450 μ l of 6 mg/ml poly(2-hydroxyethyl methacrylate) or polyHEMA (Sigma-Aldrich, St. Louis, MO, USA) each well for 24 and 48 hours. The resistant osteosarcoma cells were observed under light microscope.
