**Supplementary Material Figure S1.** Experimental designs. (a) Experimental design for matrix comparison with CT-2A tumors; (b) Microscopy of MALDI-analyzed CT-2A tumors highlighting laser destruction of tissue; scale, 50  $\mu\text{m}$ ; (c) Experimental design for validation of MALDI-TOF using bulk RNA-seq.

**(a)****Negative Polarity****(b)****Positive Polarity****Negative Polarity**

**Supplementary Material Figure S2.** Spectra for atmospheric-pressure MALDI-TOF MSI. **(a)** Spectra obtained for each sample preparation in small molecule screen with CT-2A glioma using atmospheric-pressure MALDI-TOF MSI; **(b)** Spectra obtained for each sample preparation in lipid screen with CT-2A glioma using atmospheric-pressure MALDI-TOF MSI.

**Supplementary Material Figure S5.** Further comparisons between matrix and polarity combinations for MALDI-TOF for lipids. **(a)** Number of unique background peaks for each combination in small molecule screen; **(b)** Upset plot representing a Venn diagram of sizes of overlaps between detectable chemical formulas for different sets of matrix and polarity combinations; **(c)** Upset plot representing a Venn diagram of sizes of overlaps between enriched pathways for different sets of matrix and polarity combinations colored by semantic groups of pathways.

**Supplementary Material Figure S6.** Extended differential metabolite abundance between tumor and normal regions. (a) Percentage of total Wasserstein distance between tumor and normal regions explained by top 6 differentially abundant m/z peak bins for small molecule screen; (b) Percentage of total Wasserstein distance between tumor and normal regions explained by top 6 differentially abundant m/z peak bins for lipid screen; (c) Rank-rank hypergeometric overlap plots between LC-MS and MALDI-TOF MSI differential abundance results of small molecules for recrystallized CHCA matrix in positive polarity mode; smaller p-values indicate larger overlap between ranked lists; (d) Rank-rank hypergeometric overlap plots between LC-MS and MALDI-TOF MSI differential abundance results of small molecules for 9-AA matrix in negative polarity mode; smaller p-values indicate larger overlap between ranked lists; (e) Normalized enrichment score for KEGG pathways for each combination and bulk RNA-sequencing of tumor and normal regions for lipid screen.
