Text S1: Supplemental text for Untargeted metabolomics quality control and Metabolic Knowledge-based network

1. Untargeted metabolomics quality control:

Quality control (QC) included analysis of samples pooled from extracted lung homogenate samples. Twenty-nine (29) stable isotope labelled authentic standards, 14 hydrophobic, and 15 hydrophilic were spiked into experimental samples[1,2]. An aliquot of all experimental samples was combined into a pooled QC sample and this sample was used to monitor instrumental variations. There were no QC samples prepared alongside experimental samples, as this was a small pilot study and there was only one day of sample preparation needed.

Analysis of authentic standards in pooled QC samples was performed by generating extracted ion chromatograms (EIC) using MassHunter Qualitative Analysis software version B.07 (Agilent Technologies, Santa Clara, CA) to determine if a set of samples required re-injection. Standards in QC samples were evaluated visually for reproducible peak shape and height, as well as retention time (RT) by overlaying EICs. If there was an outlier (e.g., a QC sample had multiple standards that were not reproducible within the LCMS batch), the experimental samples bracketed by that QC sample were re-injected. Once all samples were run, the signal height for each standard was analyzed in Profinder version 10.0 SP1 (Agilent Technologies) using batch targeted feature extraction. The coefficient of variation (%CV) for each standard was calculated for pooled QC and experimental samples (QC and experimental samples were kept separate for %CV calculations). For this experiment, %CVs for the authentic standards were $\leq 10\%$ for QC samples, $\leq 30\%$ for lipid experimental samples and $\leq 20\%$ for aqueous experimental samples. This is typical for this method and sample type. Variation was expected to be higher in experimental samples compared to QC samples due to biological variability stemming from experimental conditions. Note that if %CVs had been outside of these ranges, results would have been further investigated to determine if samples required re-analysis and/or if outliers existed and should be excluded from further analysis.

For pooled QC samples, total ion chromatograms (TICs) were overlaid and compared to ensure chromatography was reproducible. Pooled QC samples are also compared to experimental samples using principal components analysis (PCA) to determine if outliers were present. For the current study, overlaid QCs demonstrated acceptable reproducibility and no outliers were seen with PCA. In addition to the above measures, UHPLC pressure was monitored and was +/- 1% across all runs.

2. Metabolic knowledge-based network

Expansion of compounds' knowledge-based network (network diffusion) by including KEGG metabolic pathways and GO terms indicates that the dysregulated compounds were associated with inflammatory pathways (Figure S3). The analysis showed that dysregulation in lipid metabolic pathways were implicated in the neurotrophine signaling pathway, adipocytokine signaling pathway, AGE-RAGE signaling pathway in diabetes complication, and leishmaniasis pathway via n-acyl-sphingosine [Cer(d18:1/24:1)] which was significantly decreased in HDM-sensitized mice; leishmaniasis and systematic lupus erythematosus pathways via phosphatidylserines [PS(22:6/19:0), PS(17:2/22:4), PS(22:6/17:1), PS(19:1/18:4), PS(22:6/19:1), and PS(18:3/17:2)] which were increased in HDM-sensitized mice; cardiolipin synthase via cardiolipin/1,3-diphosphatidyl-sn-glycerol [CL(20:1/18:2/18:2/18:1)] and phosphatidylglycerol [PG(16:0/0:0)], which were increased in HDM-sensitized mice; and autophagy via phosphatidylethanolamines [(PE(22:4/P-18:0), PE(20:4/P-18:1), PE(22:1/18:3), PE(18:1/P-18:1), PE(20:3/P-18:1), PE(P-38:4), PE(18:2/P-16:0), PE(18:1/18:0), PE(18:1/P-16:0), and PE(18:1/20:0)] which were decreased in HDM-sensitized mice.

Supplemental figure label

Figure S1. Dot plot showing pathway enrichment analysis of up- and downregulated compounds in house dust mite (HDM)-sensitized mice experiment. Enrichment ratio was calculated by dividing the number of hits within a particular metabolic pathway by the expected number of number of hits. Dot size increased with enrichment ratio and darker dot color indicates lower p-value.

Figure S2. Dot plot showing predicted enzyme dysregulation based on enrichment analysis of up- (a) and down- (b) regulated compounds found to be significant in-house dust mite (HDM)-sensitized versus control mice. Enrichment ratio was calculated by dividing the number of hits within a particular metabolic pathway by the expected number of number of hits. Dot size increased with enrichment ratio and darker dot color indicates lower p-value.

Figure S3. Molecular network expansions (diffusion method) to metabolic signaling pathways. Yellow eclipses are input compounds that were significantly altered in house dust mite (HDM)-sensitized mice in our experiment. Blue triangles are KEGG metabolic modules. The green hexagons are enzymes of metabolic reactions. Pink rectangles are metabolic reactions. The red diamonds are metabolic and signaling pathways relevant to the compounds and possibly to the allergy and asthma pathogenesis signaling pathways.

Figure S4. Lipid reaction prediction: the most active lipid conversion pathway. The reaction pathway was based on the Lipid Map's BioPen online software suite. Z-score is a cumulative distribution conversion of p-value of comparison between treatment and control subtracted from one (e.g., $1 - X$). The Z-score is then used to predict whether a particular reaction/pathway is significantly ($p < 0.05$, the corresponding Z-score is computed to be >1.645 .) changing between control and treated conditions. Consequently, if a pathway has Z-score > 1.645 , then a pathway is classified as active, or non-active otherwise. See reference in the text for detail.

Figure S5. Box plots of plasma bioactive lipids comparing house dust mite (HDM)-sensitized to control mice. The t-test was used for comparison between HDM-sensitized and control mice. Unadjusted p-values are provided for each lipid.

Figure S6. Box plots of lung tissue bioactive lipids comparing house dust mite (HDM)-sensitized to control mice. The t-test was used for comparison between HDM-sensitized and control mice. Unadjusted p-values are provided for each lipid.

Figure S7. Joint metabolomics and gene expression data pathway enrichment analysis. The x-axis shows the impact of the pathways and y-axis shows the negative log 10 transformed p-values of the pathways. The size of the bubble indicates the number of hits from experimental data in a particular pathway. Pathway impact is calculated by adding up the importance measures of each of the matched compounds and then dividing by the sum of the importance measures of all compounds in each pathway.

Supplemental Tables

Table S1. Significantly up- and downregulated compounds in house dust mite (HDM)-sensitized mice compared to control mice. This list contains only annotated compounds. Compounds in all capital letters with ** denote those that matched to the in-house database comprised of authentic standards and are identified at MSI level 1.

Table S2. Significantly up- and downregulated genes in house dust mite (HDM)-sensitized mice compared to control mice. This list includes only successfully annotated genes. Genes were ordered by p-value from small to large and by direction of fold-change.

Gene id	log2 Fold Change	P-adj	MGI symbol	Gene biotype	Function	Go id	Regulation

Table S3. Relevant genes' function literature review. A literature review was conducted to determine potential relevance of significant genes to allergy and/or asthma.

	Gene name	Functions	Literature support
Top five upregulated genes	Col24a	Immune	Participate in regulating type I collagen fibrillogenesis [3] and differentially expressed in T-cell of obese asthmatics compared to normal weight asthmatics [4]
	Nlrp4g	Immune	Plays a pivotal role in the innate immune and reproductive systems in the mouse and human [5-9]
	Samd4b		Overexpression inhibits the transcriptional activities of AP-1, p53/TP53 and CDKN1A[10] and nasal tissue expression increased with severity of hyperinflation in COPD patients [11]
	Med29		A general transcription factor of RNA polymerase II [12] and implicated in tumor suppression effect through control of cell cycle and cell division [13]
	Ganab	Immune	Encodes the alpha subunit of glucosidase II and a member of the glycosyl hydrolase 31 family of proteins which are involved in Glycosylation of proteins [14] and lipids (glycosphingolipids) [15] and plays a role in the maturation process of both innate and adaptive immune responses [16,17]
Upregulated immune genes	Chil4	Immune	Enables chitin binding activity and kinase binding activity, has low chemotactic activity for eosinophils, and may play a role in inflammation and allergy [18,19]
	Chil6	Immune	Degrades chitin and chitotriose, plays a role in T-helper cell type 2 (Th2) immune response (contributes to the response to IL-13 and inflammation in response to IL-13), stimulates chemokine production by pulmonary epithelial cells, and protects lung epithelial cells against apoptosis and promotes phosphorylation of AKT1 [20-23] and associated with asthma [24,25]
	Cxcr6	Immune	A chemokine receptor with unique binding to CXCL16, which can exist in transmembrane and soluble forms and produced by epithelial and immune cells and can serve as an alarmin to recruit cells to the site of inflammation[26-28]
	Macir	Immune	A regulator of macrophage function, by inhibiting glycolysis and enhancing the resolution of inflammation and wound repair functions mediated by M2 macrophages [29]

	Clec2g	Immune	Encodes a member of the natural killer cell receptor C-type lectin family is a receptor for KLRB1 that protects target cells against natural killer cell-mediated lysis [30], inhibits osteoclast formation [31], and modulates the release of interferon-gamma [32]
Upregulated metabolism genes	Atp10d	Metabolism	A lipid metabolism related upregulated gene that enables glycosylceramide flippase activity and predicted to be involved in phospholipid translocation [33]
	Ivd	Metabolism	Catalyzes the conversion of isovaleryl-CoA/3-methylbutanoyl-CoA to 3-methylbut-2-enoyl-CoA as an intermediate step in the leucine (Leu) catabolic pathway and catalyzes the oxidation of other saturated short-chain acyl-CoA thioesters as pentanoyl-CoA, hexenoyl-CoA and butenoyl-CoA [34]
Top downregulated genes	Ces2a	Metabolism	Hydrolyze a wide range of xenobiotic and endogenous compounds, including lipid esters such as triacylglycerol (TG), diacylglycerol (DG), and endocannabinoid 2-arachidonoylglycerol (2-AG) and its cyclooxygenase (COX)-derived prostaglandin glyceryl esters [35-38]
	Sptbn4	Metabolism	Variants of this gene disrupt the cytoskeletal machinery that controls proper localization of ion channels and the function of axonal domains, thereby generating severe neurological dysfunction [39,40]
	Hsd17b1	Metabolism	Belongs to the short-chain dehydrogenases/reductases (17 beta-Hydroxysteroid dehydrogenases/17-ketosteroid reductases, 17HSDs) which modulates the biological activity of certain estrogens and androgens by catalyzing reductase or dehydrogenase reactions between 17-keto- and 17 beta-hydroxysteroids [41]
	Nrxn2		Encodes a member of the neurexin gene family protein products that function as cell adhesion molecules and receptors in the vertebrate nervous system [42,43]
	Gpr137c	Immune	May be involved in positive regulation of TORC1 signaling [44]
Downregulated immune genes	Btnl4		Expressed specifically by thymic epithelial cells and keratinocytes involved in T cell receptor signaling pathway and regulation of cytokine production [45,46]

	Lifr	Immune	Encodes a protein that belongs to the type I cytokine receptor family (a subunit of a receptor for leukemia inhibitory factor) [47,48]
	Atm	Immune	plays a role in pre-B cell allelic exclusion, a process leading to expression of a single immunoglobulin heavy chain allele to enforce clonality and monospecific recognition by the B-cell antigen receptor (BCR) expressed on individual B-lymphocytes [49]
	Zcchc9	Immune	Downregulates transcription mediated by NF-kappa-B [50]
Downregulated metabolism genes	Mtm1	Metabolism	Encodes a dual-specificity phosphatase that acts on both phosphotyrosine (dephosphorylate phosphotyrosine- and phosphoserine-containing peptides) ^[51] and phosphoserine (dephosphorylates phosphatidylinositol 3-monophosphate (PI3P) and phosphatidylinositol 3,5-bisphosphate [PI(3,5)P2]) [52-55]
	Ggta	Metabolism	Synthesizes the galactose-alpha(1,3)-galactose group by catalyzing the transfer of a galactose residue, with an alpha-1,3 linkage, on terminal lactosaminide (Gal-beta-1,4-GlcNAc-R) disaccharide borne by a glycoprotein or a glycolipid [56]
	Akt2	Metabolism	A serine/threonine kinase that is an effector molecule in the insulin signaling pathway linked to insulin's metabolic effects and lipodystrophies [57]
			REPIN1 which plays a role in glucose and lipid metabolism by differentially affecting the expression of REPIN1 target genes including glucose and fatty acid transporters [58]
	RabGAP1L	Metabolism	Recruited by ANK2 to phosphatidylinositol 3-phosphate (PI3P)-positive early endosomes, where it inactivates RAB22A, and promotes polarized trafficking to the leading edge of the migrating cells [59]
	Pask	Metabolism	Involved in energy homeostasis and protein translation under changing environmental conditions (oxygen, glucose, and nutrition) [60] and participate in respiratory regulation [61]
	Csad	Metabolism	Catalyzes the decarboxylation of L-aspartate, 3-sulfino-L-alanine (cysteine sulfinic acid), and L-cysteate to beta-alanine, hypotaurine and taurine, respectively [62,63]
