Supplementary Figures

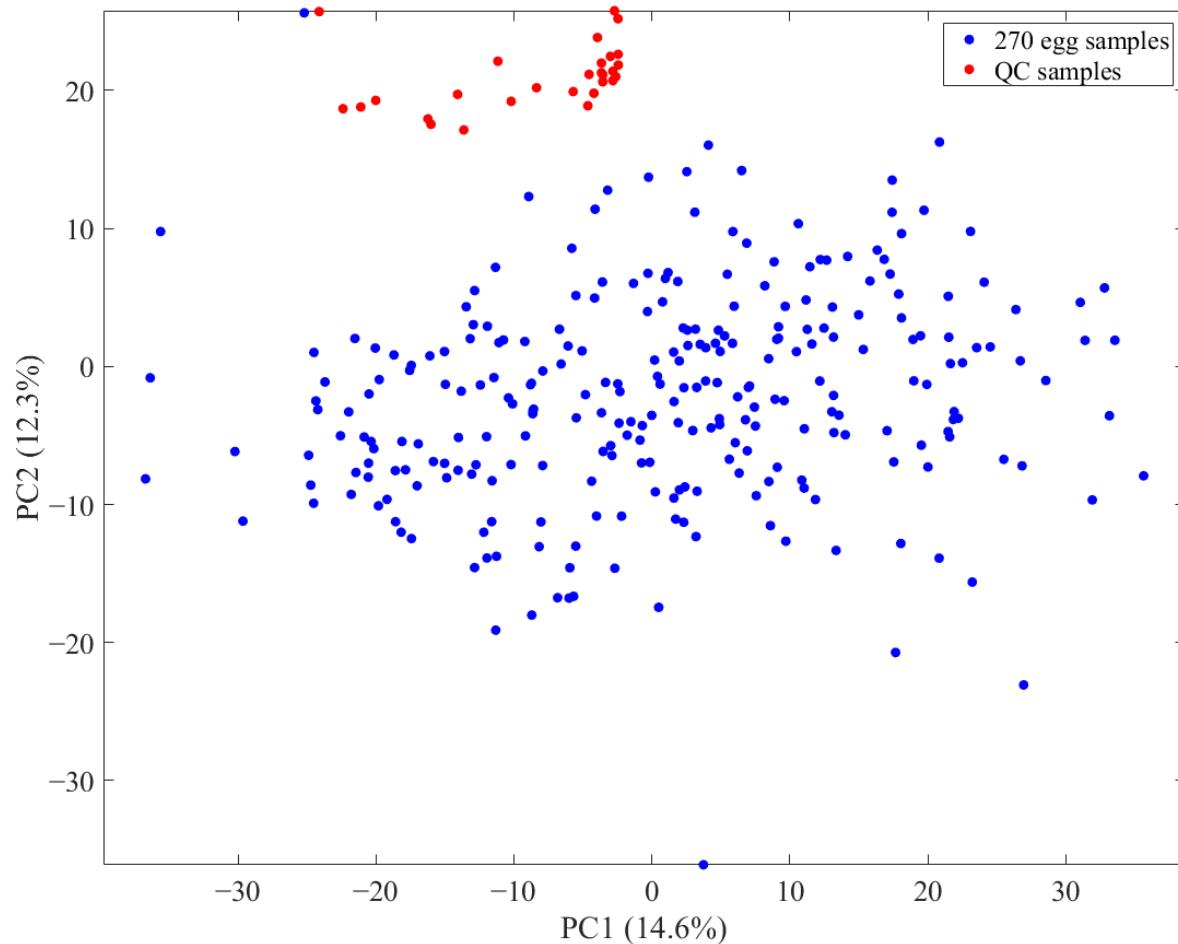

Figure S1. Scores of the PCA in which the 28 measurements of the quality control (QC) sample and the measurements of the 270 authentic samples were depicted (QC measurements as red circles, other samples as blue circles).

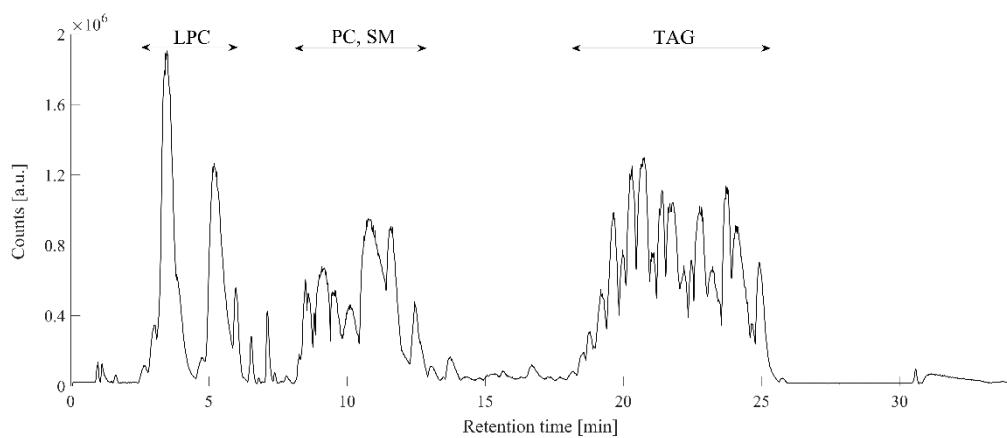

Figure S2. An exemplary total ion chromatogram of a pooled egg yolk extract. The retention time (RT) (x-axis) is plotted against the counts (y-axis). LPC: Lyso-glycerophosphocholine, PC: Phosphocholine, SM: Sphingomyelin, TAG: Triacylglycerol.

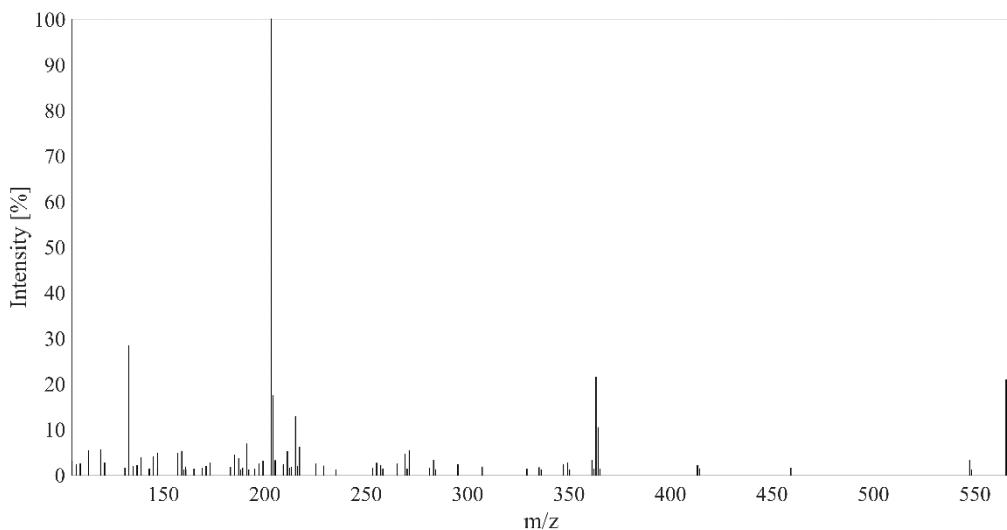

Figure S3: MS/MS spectrum of the m/z ratio 565.403 at a RT of 7.7 min in an egg sample extract. The collision energy was 10 eV. The compound was identified as canthaxanthin.

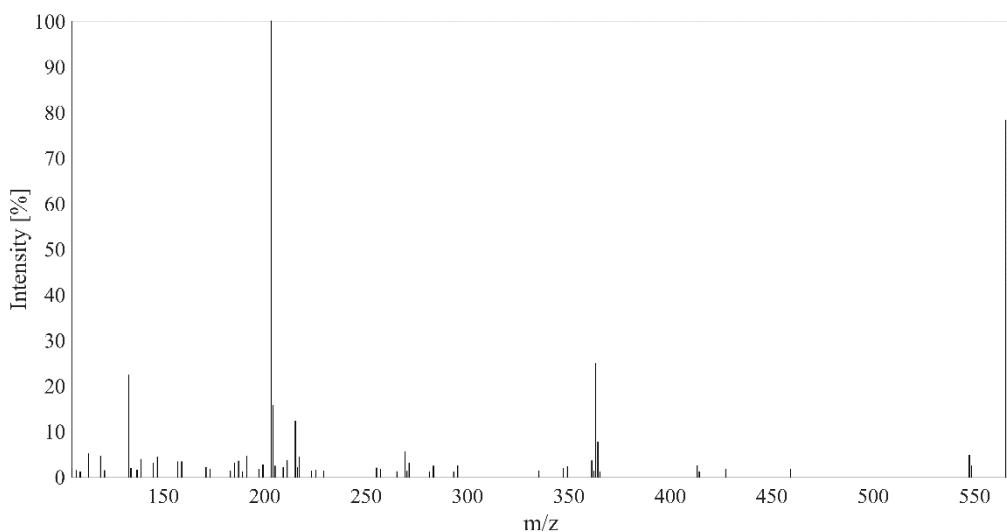

Figure S4: MS/MS spectrum of a canthaxanthin standard (m/z : 565.403; RT: 7.7 min). The collision energy was 10 eV.

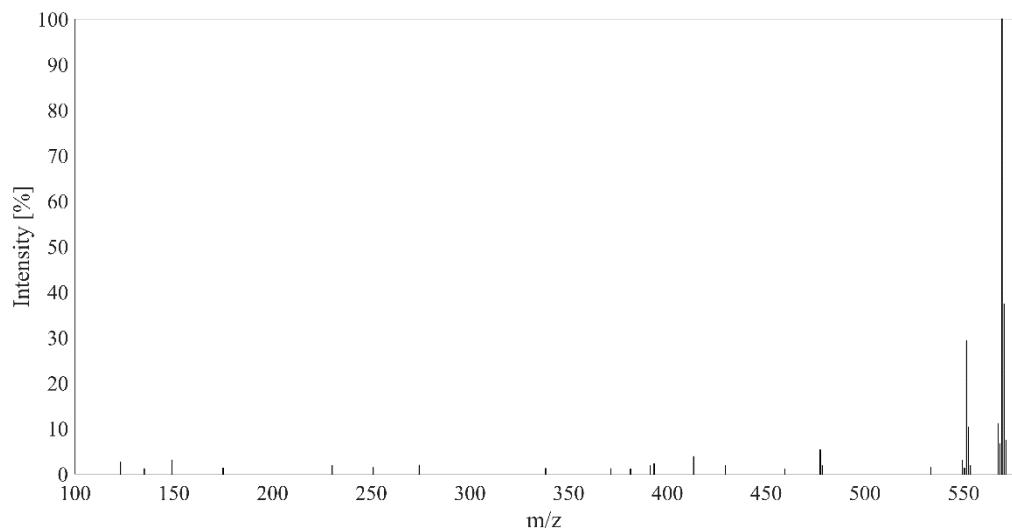

Figure S5: MS/MS spectrum of a lutein standard (m/z : 569.434; RT: 6.5 min). The collision energy was 10 eV.

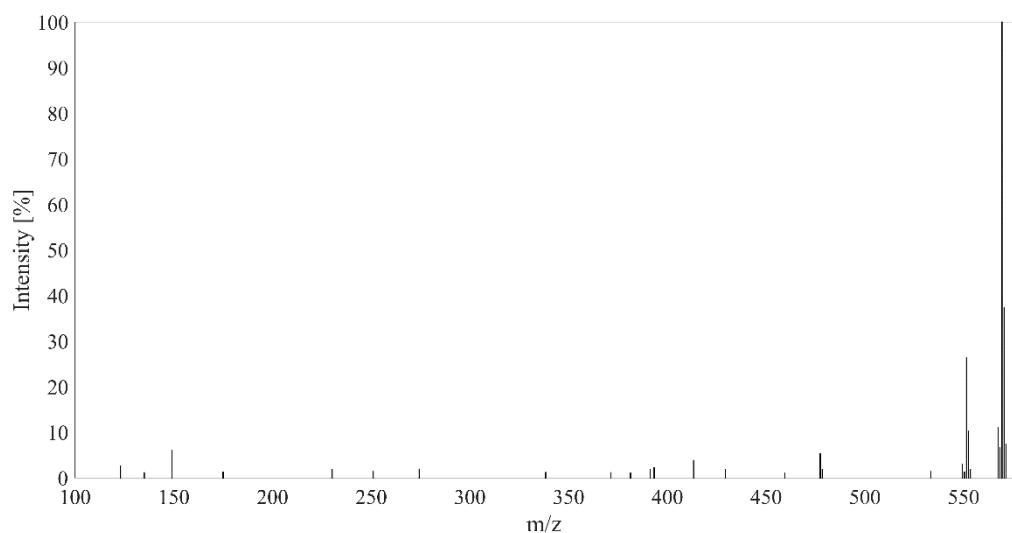

Figure S6: MS/MS spectrum of a zeaxanthin standard (m/z : 569.434; RT: 6.5 min). The collision energy was 10 eV.

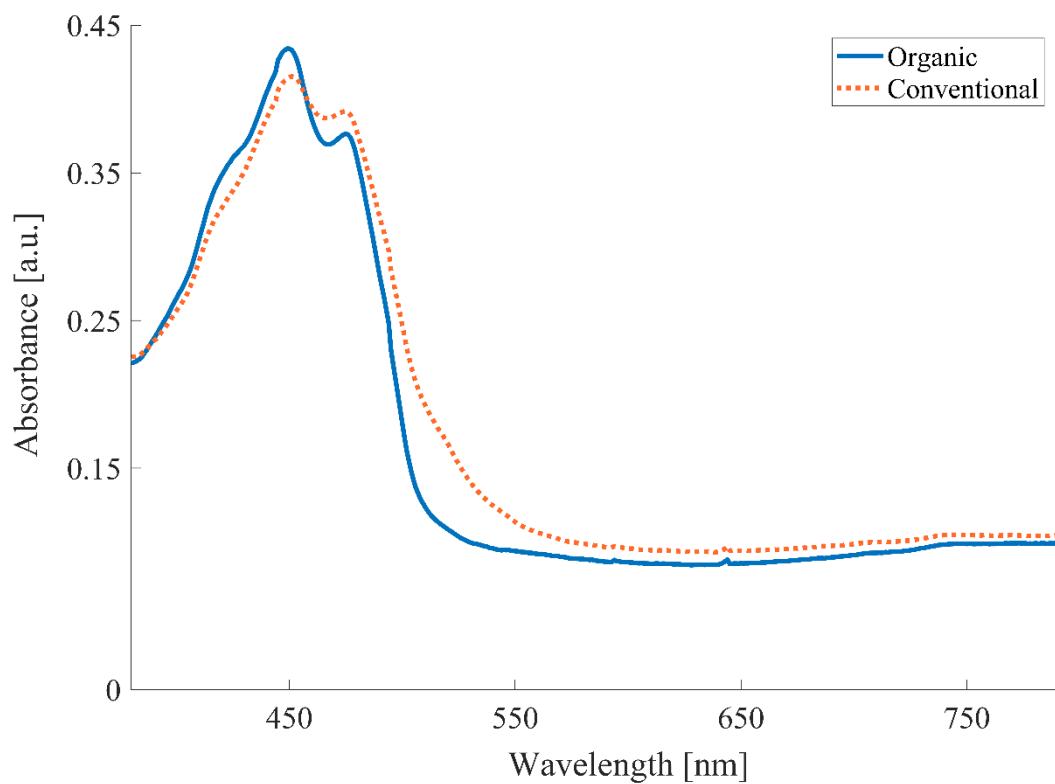

Figure S7: Comparison of the photometry spectra of egg yolk extracts from organic (blue) and conventional (orange dashed) husbandry. The individual spectra were averaged according to their husbandry. The unit of absorbance is given in absorbance unit (a.u.).

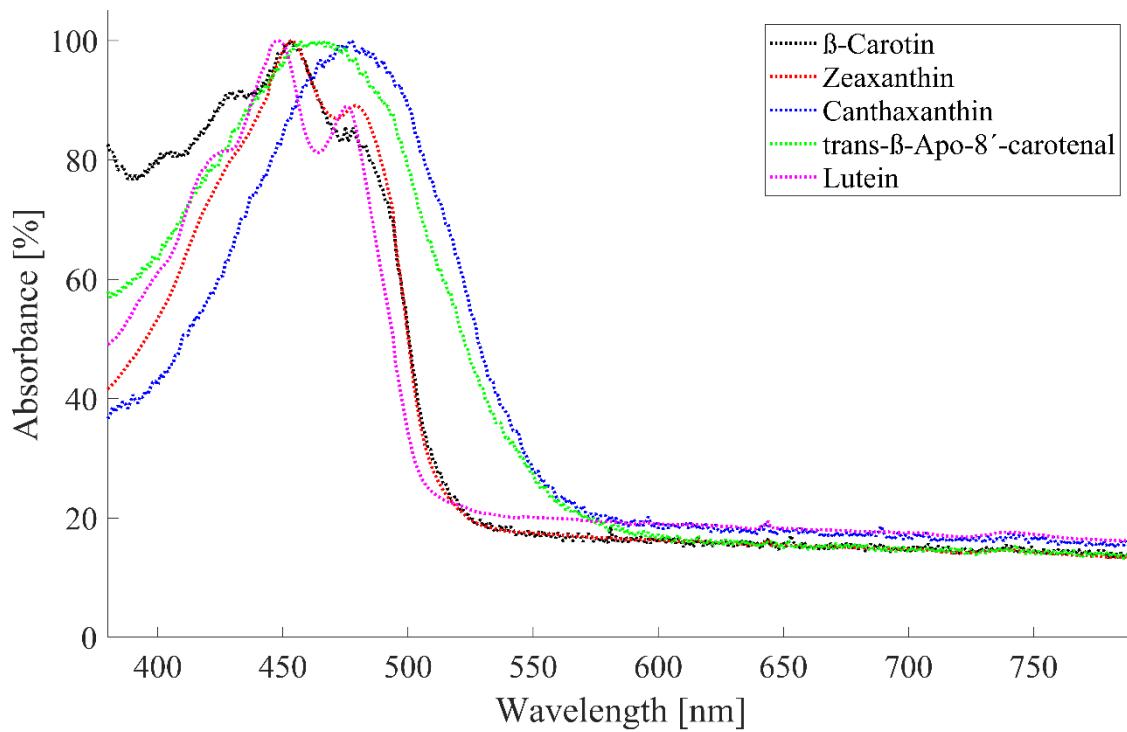

Figure S8: Comparison of the photometry spectra of carotenoid standards. The highest absorbance in the spectrum from each standard was normalized to 100% (β -Carotin: black; Zeaxanthin: red; Canthaxanthin: blue; trans- β -Apo-8'-carotenal: green; Lutein: pink).

Supplementary Tables

Table S1. Overview about the chromatography gradient. Both solvents had an addition of 0.1 mM ammonium formate at pH 3.5.

Time [min]	Water [%]	Isopropanol/methanol (3:1, v/v) [%]
0	35	65
2	35	65
3	15	85
4	15	85
26	5	95
27	0	100
29	0	100
29.1	35	65
34	35	65

Table S2. Summary of the selected variables of the LC-MS dataset with surrogate minimal depth (SMD) (DT: drift time).
