

Supplementary Material

1 Supplementary Methods

Targeted metabolomics analysis

Plasma sample (20 μ L) were thoroughly mixed containing 120 μ L of ice-cold methanol containing partial internal standards and then centrifuged at 4 °C (4000 g, 30 min). Supernatant (30 μ L) was collected, derivative reagents (20 μ L) were added. The mixture was sealed, and derivatization was carried out at 30 °C for 60 min. After derivatization, the sample was diluted with 330 μ L of ice-cold 50% methanol solution, stored at -20 °C for 20 min and centrifuged at 4 °C (4000 g, 30 min). The supernatant (135 μ L) was pipetted and 10 μ L of internal standard was added. Serial dilutions of derivatized stock standards were added to the remaining wells. An ultra-performance liquid chromatography–tandem mass spectrometry (UPLC-MS/MS) system (ACQUITY UPLC-Xevo TQ-S, Waters Corp., Milford, MA, USA) was used to quantify all targeted metabolites. The system was equipped with an ACQUITY UPLC BEH C18 1.7 μ M VanGuard pre-column (2.1 \times 5 mm) and ACQUITY UPLC BEH C18 1.7 μ M analytical column (2.1 \times 100 mm), with an injection volume of 5 μ L and flow rate of 0.4 mL/min. The column temperature was maintained at 40 °C. The mobile phase consisted of A (water with 0.1% formic acid) and B (acetonitrile/IPA; 70:30). The gradient elution procedure was as follows: 0–1 min (5% B), 1–5 min (5–30% B), 5–9 min (30–50% B), 9–11 min (50–78% B), 11–13.5 min (78–95% B), 13.5–14 min (95–100% B), 14–16 min (100% B), 16–16.1 min (100–5% B), and 16.1–18 min (5% B). The MS was alternately operated in positive-ion mode (+1.5 kV) and negative-ion mode (–2 kV). The source temperature was set to 150 °C, the desolvation temperature was set to 550 °C, and the desolvation gas flow was set to 1000 L/h. Raw data generated by UPLC-MS/MS were processed using MassLynx software (v4.1; Waters, Milford, MA, USA) for peak integration, calibration, and quantification of each metabolite. The iMAP platform (v1.0; MetaboProfile, Shanghai, China) was used for the statistical analyses. The concentrations of targeted metabolites were determined based on the calibration curves and corresponding regression coefficients.

2 Supplementary Tables

Supplementary Table S1 Ingredients and chemical composition of the diets for dairy cows

| Item | DM basis, % | Item | DM basis, % |
|----------------|-------------|--------------------|-------------|
| complete feeds | 42.74 | DM | 49.91 |
| fat powder | 1 | CP | 18.48 |
| molasses | 3.76 | NDF | 30.5 |
| corn silage | 26.59 | ADF | 17.53 |
| alfalfa hay | 15.23 | Ca | 0.83 |
| oat hay | 2.32 | P | 0.45 |
| beet pulp | 3.57 | NEL, Mcal/kg of DM | 1.74 |
| baking soda | 0.25 | | |
| cottonseed | 4.54 | | |

Note: Guaranteed value (%) of composition of each kilogram of premix: crude protein \geq 24.8, crude fat \geq 4.66, crude fiber \leq 5.34, calcium \geq 0.92, phosphorus \geq 0.4, lysine \geq 0.35, sodium chloride \geq 1. The net energy of lactation is the calculated value, and others are the measured value. DM=dry matter; CP= crude protein; NDF= neutral detergent fiber; ADF= acid detergent fiber; Ca= calcium;

P=phosphorus; NEL=net energy of lactation.

Supplementary Table S2 Dry matter intake in postpartum dairy cows

| Item | Testing time | Group | | |
|------|--------------|---------|-------|-------|
| | | Control | L-DBT | H-DBT |
| DMI | 0d | 7.17 | 7.04 | 7.21 |
| (kg) | +7d | 17.59 | 17.83 | 17.81 |
| | +14d | 18.03 | 18.09 | 18.13 |

Supplementary Table S3 Effect of DBT on the relative abundance of hindgut bacteria in dairy cows(+7d)

| Item | Relative abundance | | SEM | P-Value |
|------------------------|--------------------|----------|-------|---------|
| | C7 (%) | DBT7 (%) | | |
| <i>UCG-009</i> | 1.070 | 0.664 | 0.092 | 0.038 |
