

Figure S1. *Pseudomonas cannabina* pv. *alisalensis* KB211 WT and NU19 growth in KB medium. These strains were adjusted to an OD₆₀₀ of 0.01 in KB medium and incubated with shaking at 28°C. Bacterial growth was quantified at 6, 9, 12, and 24 h. Vertical bars indicate the standard error for three biological replicates. Asterisks indicate a significant difference from the water treatment control in a t-test (** $p < 0.01$).
