

Figure S4. Bacterial populations in cabbage syringe-inoculated with *Pseudomonas cannabina* pv. *alisalensis* KB211 WT, $\Delta cmaA$, and NB35 (TTSS mutant). Cabbage plants were syringe-inoculated with 5×10^7 CFU/ml of inoculum. The bacterial populations in the plant were evaluated at 6 hpi. Vertical bars indicate the standard error for at least three independent experiments.
