

Figure S3. Effect of cytokinin treatment on primary root length of Arabidopsis wild type (GK2) and *acs11* mutant under B deficiency. Time-course of primary root length was measured in Arabidopsis wild type (GK2) (A) and *acs11* mutant (B) in control (filled circles), control plus 50 nM *trans*-zeatin (open circles), B-deficient (filled triangles), and B-deficient plus 50 nM *trans*-zeatin (open triangles) treatment for 2 days. Results are given as means \pm SD (n=24 separate plants).
