

Figure S1. Dose-response curve of primary root elongation to external concentrations of *trans*-zeatin in control (black bars) and B-deficient (white bars) after 24 h (A), 48 h (B), 72 h (C) and 96 h (D) treatments with B. Results are given as means \pm SD ($n = 24$ separate plants). Different letters indicate statistically significant differences between treatments according to ANOVA with Tukey's HSD test ($P < 0.01$).
